Faculty of Physics and Astronomy

Module Manual
Master of Science (M.Sc.) in Physics

PO 2023

Ruhr-Universität Bochum

SoSe 26

Stand 11.06.2026

1. General Information

The Master of Science in Physics programme has a standard period of study of 4 semesters and a total of 120 credit points (CP). The study programme is divided into different areas. In the first-year compulsory elective modules include in-depth modules from experimental and theoretical physics (15-36 CP) as well as diverse modules from minor subjects (5-18 CP). For the specialization, courses amounting to 15-25 CP must be chosen in one subject area (astronomy/astrophysics, biophysics, solid state physics, nuclear and particle physics or plasma physics). In the area of key competences, the obligatory module "project management" must be chosen and further modules of up to 10 CP can be selected. A list of the approved modules can be found in this module handbook. In the second-year compulsory modules amounting to 60 CP cover the subject specific and interdisciplinary preparation and execution of the final thesis.

2. Study Plan

The distribution of 120 CP to be completed in the physics degree programme is illustrated in the following table:

Master of Science	Semester	Experimental physics	Theoretical physics	Focus area	Minor subject	Key qualifications	Master's thesis
		9-18 CP	6-18 CP	15-25 CP	5-18 CP	5-15 CP	60 CP
First year	1	Elective modules experimental physics (astro/bio/solid state/ nuclear and particle/plasma)	Elective modules theoretical physics (thermodynamics and statistical/advanced quantum mechanics/general relativity)	Specialised lecture/seminar/ advanced lab work (astro/bio/solid state/ nuclear and particle/plasma) (oral exam 2 CP)	Physics-related courses of other faculties (e.g. math, engineering, etc.)	e.g. C++ or Scientific Writing	
	2	Elective modules experimental physics (astro/bio/solid state/ nuclear and particle/plasma)	Elective modules theoretical physics (astro/solid state/plasma)		Physics-related courses of other faculties (e.g. math, engineering, etc.)	Project management	
Second year	3						Knowledge of methods and project planning Project seminar for the Master's thesis
	4						Master's thesis

Key

- Experimental physics
- Theoratical physics
- Focus areas
- Minor subject
- Key qualifications (choice)
- Key qualifications (oblig.)
- Master's thesis and prepatory courses

3. Counselling and information services at the Faculty of Physics and Astronomy

If you have any questions in connection with the subject of physics, please contact the student advisory service for physics. They offer appointments five days a week. There are no regular office hours, so you must make an appointment in person, by phone or by e-mail in advance.

Our student advisors for the Master's programme in Physics:

National Students	International Students
Dr. Ivonne Möller NB 02/169 Fon.: +49(0)234-32-29105 moeller@physik.rub.de	Dr. Niklas Fornefeld NB 02/171 Fon.: +49(0)234-32-27581 master-international@physik.rub.de

Before starting their studies, every student must attend a counselling appointment. In addition to individual appointments, group appointments are also offered. The students are informed about the appointments by e-mail.

General information and forms are provided in the Moodle course "Physics Study Info". After enrolment all students get access to the course.

4. Module Overview:

Modul	Description	Semester	Exam
Modul 1.x 9 -18 CP	One (or two) elective module(s) from one of the following subject areas from experimental physics: astrophysics, bio-physics, solid state physics, nuclear and particle physics or plasma physics. Each module consists of a lecture with exercise as well as experiments from the advanced practical course from the respective subject area.	1.+2.	graded, the partial performances achieved are weighted with the CP in the module grade. One module from 1a to 1e (of choice) must be completed. A further module can be taken.
Modul 2.x 6 -18 CP	At least one elective module must be selected. Up to three modules can be taken (6-18 CP). Each module consists of a lecture with exercise. * **If module 2f has been taken already during the bachelor's progamme one of the other modules must be chosen.** If the module "Introduction to Quantum Mechanics and Statistics" was included in the Bachelor's degree programme in Physics at the Ruhr University Bochum on 28 September 2015 (PO 2015) has been included in the Bachelor's degree, one of the modules s 'General Relativity' or 2a 'Advanced Quantum Mechanics' may be chosen instead of module 2f 'Thermodynamics and Statistical Physics'	1.+2.	Graded, via a module final written exam, an oral examination or an exercise certificate. Module 2f 'Thermodynamics and Statistical Physics' must be selected* if this module has not already been included in the Bachelor's degree. Two further modules of free choice can be taken. Graded, the partial performances achieved are weighted with the CP in the module grade.
Modul 3.x 15-25 CP	One compulsory elective module from one of the following focus areas: Astro-physics, Biophysics, Solid State Physics, Nuclear and Particle Physics or Plasma Physics. Courses in experimental and/or theoretical physics from the respective subject area can be selected	1.+.2	Graded, via a final oral module examination (2 CP). One seminar (2 CP) and advanced lab work (min. 5 CP) must be proven.
Modul 4.x 5-18 CP	Elective modules of 5- 18 CP from the catalogue of minor subjects (e.g. mathematics, chemistry, geosciences, ICAMS, neuroscience, engineering science). A complete list of all modules can be found further on in the module handbook.	1.-4.	Graded, via a final module examination, final oral module examination, seminar, lecture, study-related exercises and active participation, protocols, practical exercises or home-work.

Modul 5.x 0-10 CP	Elective modules in the amount of 0-10 CP from the area of key competences	1.-4.	Graded, via a module final examination, oral module final examination, seminar, lecture, study-related exercises and active participation, protocols, practical exercises or term paper.
Modul 6 5 CP	Project Management	1.+2.	ungraded, via active participation
Modul 7 15 CP	Methods and Project Planning (M.Sc.)	3.	ungraded, via active participation
Modul 8 15 CP	Project seminar for the Master's thesis	3.+4.	Graded via active participation and seminar talk
Modul 9 30 CP	Master thesis	3.+4.	graded, via two expert reports

5. Modularisation concept and forms of examination:

Examinations can take the form of a written examination, an oral examination, a seminar paper, a presentation, a term paper, a written report, a project, a practical exercise or a tutorial. The form of examination for each module can be found in the module descriptions. In the case of alternative options, a form of examination is determined by the lecturer at the beginning of the module.

All modules are completed with an examination. The compulsory modules "Project Management" and "Methodological Knowledge and Project Planning" remain ungraded. All graded modules are weighted with the CP in the final grade.

The "focus module" (compulsory elective modules 3.x) concludes with an oral examination, which is credited with 2 CP. For all other courses in the focus module the following applies: semester hour per week = CP.

The current range of courses offered by the Faculty of Physics and Astronomy can be found on eCampus.

All examinations at the faculty take place in fixed examination periods. The first examination period is at the end of the lecture period, the second at the end of the lecture free period

Please note:

- All modules and courses, except for “Project Management” and “Methodological Knowledge and Project Planning (M.Sc.),” must be assigned to the degree program with a grade.
- For ungraded courses, a grade of 4.0 must be entered when assigning them to the degree program.

Modul 1b Introduction to Biophysics

	Credits	Workload	Semester	Cycle	Duration
	9 CP	270 h	from 1. Sem.	Winter	1-2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Biophysics b) Exercises for Introduction to Biophysics c) Advanced Laboratory Courses for Physicists (three experiments in Biophysics)	a) 44 h b) 22 h c) 21 h	183 h	a) unlimited b) 30 c) 2

Requirements for Participation
Formal None
Content Basic knowledge in Physics I-III (Bachelor) will be highly appreciated
Preparation None

Learning Outcomes
After successfully completing this module, the students
- have a basic understanding of molecular structures of living matters
- can realise the relation between the basic knowledge from experimental and theoretical physics and the examination of biological systems, and they can use them to describe equilibriums and reactions
- are familiar with the basic physical methods for examining molecular biological processes
- can plan, execute, evaluate and record in writing biophysical experiments and to discuss the results in the scientific context
- have received a first glance at current research topics of molecular biophysics at Ruhr-University Bochum
- can acquire relevant scientific contents, theories, and methods, both guided and independent, and they can communicate their results both orally and written

Contents
- Structure of biological Matter: from the atom to the protein
- Spectroscopical methods
- Methods for determining structures of proteins (X-ray crystallography, NMR, electron microscopy)
- Fundamentals of reaction kinetics and electrochemistry

Format of Teaching Lecture, Exercises, Practical Exercises (Laboratory Course)

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture. The advanced laboratory course is examined via practical exercises and protocols.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course. In addition, the advanced laboratory course must be successfully completed. Both grades go into the module grade with the CP-weighted.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to credit points

Module Supervisor and Instructor Prof. Dr. Hofmann

Further Information

Modul 1c Introduction to Nuclear and Particle Physics

	Credits	Workload	Semester	Cycle	Duration
	9 CP	270 h	from 1. Sem.	Winter	1-2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Nuclear and Particle Physics b) Exercises for Introduction to Nuclear and Particle Physics c) Advanced Laboratory Courses for Physicists (three experiments in Nuclear and Particle Physics)	a) 44 h b) 22 h c) 21 h	183 h	a) unlimited b) 30 c) 2

Requirements for Participation
Formal None
Content Knowledge of Physics I-III (Bachelor) will be expected
Preparation None

Learning Outcomes
After successfully completing this module, the students
- have a basic understanding of the structure of matter and its interactions as well as radioactivity
- are aware of the possible applications of nuclear physical processes in technology and medicine
- know the fundamental concepts of electromagnetic, weak, and strong interaction
- are familiar with general measurement techniques and methods and can evaluate advantages and disadvantages of nuclear physical and radioactive processes
- see correlations between processes in the universe and in nuclear and particle physics
- can evaluate the place into context the results of nuclear physical and radioactive processes

Contents
Nuclear physics processes in the universe, structure of matter from elementary particles - the standard model of particle physics, structure and description of atomic nuclei, relativistic heavy ion physics, interaction of ponds with matter and detectors based on them, introduction to quantum field theory, processes of the strong and electroweak interaction, scattering and decay experiments, particle accelerators, applications of nuclear and particle physics in technology and medicine, radioactivity and radiation exposure, evaluation of experiments.

Format of Teaching Lecture, Exercises, Practical Exercises (Laboratory Course)

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture. The advanced laboratory course is examined via practical exercises and protocols.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course. In addition, the advanced laboratory course must be successfully completed. Both grades go into the module grade with the CP-weighted.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to credit points

Module Supervisor and Instructor Prof. Dr. Mikhasenko

Modul 1d Introduction to Plasma Physics

	Credits	Workload	Semester	Cycle	Duration
	9 CP	270 h	from 1. Sem.	Summer	1-2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Plasma Physics b) Exercises for Introduction to Plasma Physics c) Advanced Laboratory Courses for Physicists (three experiments in Plasma Physics)	a) 44 h b) 22 h c) 21 h	183 h	a) unlimited b) 30 c) 2

Requirements for Participation
Formal None
Content Knowledge of Physics I-III (Bachelor) will be appreciated
Preparation None

Learning Outcomes
After successfully completing this module, the students

- Have a basic understanding of the important characteristics of a plasma and of the forms of describing plasma in the single particle model, and of the kinetic and fluid description
- Are aware of the applications of low and high temperature plasma and their locking concepts
- Know the fundamental concepts of plasma equilibrium
- Are familiar with the dynamics of plasma
- Can see correlations between plasma heating and plasma properties and can apply physical measurement techniques to known problems

Contents
Basic concepts and plasma definition, single particles in magnetic fields, collision interactions, hydro-dynamics, magnetohydrodynamics, kinetic theory, boundary layers, waves in plasmas, basics of controlled fusion, special forms of discharge

Format of Teaching Lecture, Exercises, Practical Exercises (Laboratory Course)

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture. The advanced laboratory course is examined via practical exercises and protocols.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course. In addition, the advanced laboratory course must be successfully completed. Both grades go into the module grade with the CP-weighted.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Golda, Prof. Dr. van Helden

Further Information

Modul 1e Introduction to Solid State Physics

	Credits	Workload	Semester	Cycle	Duration
	9 CP	270 h	from 1. Sem.	Winter	1-2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Solid State Physics b) Exercises for Introduction to Solid State Physics c) Advanced Laboratory Courses for Physicists (three experiments in Solid State Physics)	a) 44 h b) 22 h c) 21 h	183 h	a) unlimited b) 30 c) 2

Requirements for Participation
Formal None
Content Basic knowledge in Physics I-III (Bachelor) will be highly appreciated
Preparation None

Learning Outcomes
After successfully completing this module, the students
- Have a basic understanding of how quantum mechanical and classical processes influence macroscopic and microscopic characteristics of solid-state matter
- Are aware of the possibilities of the general concepts to derive the optical, thermal and electronic properties of solid-state matter from the basic methods of physics and to achieve at least a qualitive understanding of those concepts
- Know the fundamental concepts of applying quantum mechanics to solid state systems
- Are aware of scattering phenomena in the position and momentum space
- Can see and apply relations between atomic and solid-state physics with regards to electronic, phononic and photonic band structure.

Contents
- Geometric structure of solid state matter (ideal crystals, misorder, reciprocal lattice, determining crystalline structure via diffraction, bonding phenomena)
- Dynamics of the crystalline lattice (lattice oscillations, phonons, Bose-Einstein-distribution, thermal properties of non-conductors, scattering experiments)
- Electrons in solid state matter (Classical free electron gas, Fermi-Dirac-Distribution, electric conductivity, thermal properties of conductors, metallic bonding, charges in magnetic fields, band model, experimental determination of band gaps, semi-conductors, thermal excitation of charges, effective mass, conducting by holes and faults, pn-junction

Format of Teaching Lecture, Exercises, Practical Exercises (Laboratory Course)

Format of examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture. The advanced laboratory course is examined via practical exercises and protocols.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course. In addition, the advanced laboratory course must be successfully completed. Both grades go into the module grade with the CP-weighted.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to credit points

Module Supervisor and Instructor Prof. Dr. Moser

Further Information

Modules 2 (Elective Modules from Theoretical Physics)

Modul 2a Advanced Quantum Mechanics

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Advanced Quantum Mechanics b) Exercises for Advanced Quantum Mechanics	a) 44 h b) 22 h	114 h	a) unlimited b) 30

Requirements for Participation
Formal None
Content Knowledge of the contents of "Introduction to Quantum Mechanics and Statistics" (Bachelor) will be expected
Preparation None

Learning Outcomes
After successfully completing this module, the students

- Understand advanced concepts of quantum mechanics, enabling them to analyse complex physical phenomena
- Can see and apply fundamental correlations between symmetries in quantum mechanics and its underlying mathematical form of group theory
- Have an overview of the most important approximative methods of quantum mechanics and can apply them independently to non-relativistic phenomena
- Are familiar with scattering theory and the quantum mechanical treatment of identical particles
- Gained basic knowledge of relativistic field equations and their quantification

Contents
Symmetries in quantum mechanics, addition of angular momentum, selection rules, approximation methods and their applications, scattering theory, systems of identical particles, field quantisation, relativistic wave equations

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 180 min or oral examination of 45 min) for the module.

Requirements for the Attribution of Credit Points Passing the examination

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Eremin

Further Information

Modul 2b General Relativity

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture General Relativity b) Exercises for General Relativity	a) 44 h b) 22 h	114 h	a) unlimited b) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successfully completing this module, the students

- Have a basic understanding of gravity as curvature of space-time
- Are aware of the possibilities of differential-geometric methods
- Know the fundamental concepts of gravity and their applications
- Can see connections between physical ideas and can apply their mathematic form

Contents

- Special relativity and flat spacetime: Lorentz transformations; vectors and dual vectors (1- forms); tensors; Maxwell equations; energy-momentum tensor; classical field theory.
- Manifolds: Gravity as a geometric property; What is a manifold; Vectors, tensors, metrics; An expanding universe; Causality; Tensor densities; Differential forms; Integration
- Curvature: covariant derivative; parallel transport and geodesics; the Riemann curvature tensor; symmetries and Killing vectors; maximally symmetric spaces; geodesic divergence
- Gravitation: physics in curved spacetime; Einstein equations; Lagrangian formulation; the cosmological constant; alternative theories
- The Schwarzschild solution: the Schwarzschild metric; Birkhoff's theorem; singularities; geodesics of the Schwarzschild solution; black holes; the maximally extended Schwarzschild solution
- Cosmology: Maximally symmetric universe; Robertson-Walker metric; the Friedmann equation; scale factor dynamics; redshift and distances; Gravitational lensing; inflation

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min or oral examination of 30 min) for the module.

Requirements for the Attribution of Credit Points Passing the examination

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Grauer

Further Information

Modul 2c Introduction to Theoretical Astrophysics

	Credits	Workload	Semester	Cycle	Dauer
	6 CP	180 h	from 1. Sem.	Summer	1 Semester
Courses a) Lecture Introduction to Theoretical Astrophysics b) Exercises for Introduction to Theoretical Astrophysics			**Contact Hours** a) 44 h b) 22 h	**Self-Study** 114 h	**Group Size** a) unlimited b) 30

Requirements for Participation
Formal None
Content Basic knowledge of theoretical physics (Bachelor level) is highly appreciated
Preparation None

Learning Outcomes
After successfully completing this module, the students

- Have a basic understanding of theoretical astrophysics
- Are aware of the possibilities of the used mathematisation and modelling
- Know the fundamental concepts for describing astrophysical environments
- Are familiar with different theoretical methods
- Can see and successfully apply correlations between astrophysics, respective examples and different branches of physics (nuclear and particle physics, plasma physics)

Contents
Methods and results of astrophysics are introduced for selected astrophysical systems and discussed in connection with current research results. Focal points are selected from the following topics: Astrophysics: definition and fundamentals (the latter are provided in short digressions as required); Stars: state variables, formation, structure, evolution and final states; Stellar winds: acceleration, structure and interaction with the interstellar medium; Stellar atmospheres: Structure and radiative transfer; Stellar winds: acceleration, structure and interaction with the interstellar medium; Milky Way, galaxies: structure; Cosmic rays: acceleration and transport.

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the Attribution of Credit Points Depending on the defined form of examination: Passing the written/oral examination or obtaining at least 50 % of the possible points in the weekly exercises. In this case, active participation in the exercises is also compulsory. The form of examination is determined at the beginning of the course.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor PD Dr. Fichtner

Further Information

Modul 2d Introduction to Theoretical Plasma Physics

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Theoretical Plasma Physics b) Exercises for Introduction to Theoretical Plasma Physics	a) 44 h b) 22 h	114 h	a) unlimited b) 30

Requirements for Participation
Formal None
Content Basic knowledge of theoretical physics, especially electrodynamics (Bachelor level), is highly appreciated
Preparation None

Learning Outcomes
After successfully completing the module, the students

- have gained a basic understanding of the problems of theoretical model building for a complex many-particle system.
- are familiar with the descriptions of plasmas based on kinetic and fluid dynamic theories and can assess the possibilities and limitations of such models
- know the basic mathematical techniques for working within the framework of the theories developed in the module
- are familiar with respective plasma-physical applications of the theories and methods in the context of astrophysics and space physics and have an insight into the parameter regimes found there
- have gained initial experience in the numerical modelling of plasma-physical processes in the context of the practical experiments and have carried out corresponding computer simulations.

Contents
Basic concepts of classical plasma physics, single particle motion, kinetic theory, fluid theory, magnetohydrodynamics, equilibrium theory, waves and instabilities, applications in astro- and space-physical context, numerical modelling of plasmas

Format of Teaching Lecture, Exercises, numerical computer simulation

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Innocenti

Further Information

Modul 2e Introduction to Theoretical Solid State Physics

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Theoretical Solid State Physics b) Exercises for Introduction to Theoretical Solid State Physics	a) 44 h b) 22 h	114 h	a) unlimited b) 30

Requirements for Participation
Formal None

Content Knowledge of theoretical physics, including the contents of "Introduction to Quantum Mechanics and Statistics" (Bachelor), will be expected

Preparation None

Learning Outcomes
After successfully completing the module, the students

- Know the fundamental concepts of solid state theory
- Having a basic understanding of the microscopic properties with regards to structure, the properties of oscillation, and the electronic properties and their influence on the macroscopic behavior of the solid state
- Are familiar with the mathematical representation of solid states (second quantification, sudden breaking of symmetry, phase transition, elementary excitation)
- Can solve and interpret typical exercises of solid state theory

Contents

- Geometric structure of the solid
- (ideal crystals, disorder, reciprocal lattice, crystal structure determination by diffraction, bonding ratios)
- Dynamics of the crystal lattice
- (lattice vibrations, phonons, Bose-Einstein distribution, thermal properties of the non-conductor, scattering experiments)
- Electrons in the solid state
- (classical free electron gas, Fermi-Dirac distribution, electrical conductivity, thermal properties of conductors, metallic bonding, charge carriers in the magnetic field, band model, experimental determination of band gaps, semiconductors, thermal excitation of charge carriers, scattering experiments)
- excitation of charge carriers, effective mass, hole conduction, impurity conduction, pn junction)

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Scherer

Further Information

Modul 2f Thermodynamics and Statistical Physics

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Thermodynamics and Statistical Physics b) Exercises for Thermodynamics and Statistical Physics	a) 44 h b) 22 h	114 h	a) unlimited b) 30

Requirements for Participation
Formal None
Content Knowledge of the contents of "Introduction to Quantum Mechanics and Statistics" (Bachelor) will be expected
Preparation None

Learning Outcomes
After successfully completing this module, the students
- Have a basic understanding of the concepts of statistical mechanics
- Know the fundamental concepts of quantum statistics
- Are familiar with fundamental definitions of classical and quantum mechanical statistical physics
- Can solve typical problems of non-interacting multi-particle physics

Contents
Quantum statistics and classical statistical mechanics, thermodynamics, applications. Starting point is the simple statistics of many particles thermodynamics are derived from this. Afterwards quantum statistics with applications

Format of Teaching Lecture, Exercises

Format of Examination Written examination of 120 min

Requirements for the Attribution of Credit Points Passing the examination

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Innocenti

Further Information The module "Statistical Physics" (till 2023) is equivalent to the module "Thermodynamics and Statistical Physics" (from 2024).

The module 'Thermodynamics and Statistical Physics must be selected if this module has not already been included in the Bachelor's degree.
If the module "Introduction to Quantum Mechanics and Statistics" was included in the Bachelor's degree programme in Physics at the Ruhr University Bochum on 28 September 2015 (Official Announcement No. 1097) has been included in the Bachelor's degree, one of the modules 'General Relativity' or 'Advanced Quantum Mechanics' may be chosen instead of the module 'Thermodynamics and Statistical Physics'

Modules 3 (Elective Modules for the Focus Area)

Modul 3a Astrophysics/Astronomy

	Credits	Workload	Semester	Cycle	Duration
	15-25 CP	450-750 h	1.-2. Sem.	Winter & Summer	2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture b) Exercises c) Seminar (at least 2 CP) d) Advanced Laboratory Courses (at least 5 CP) A complete overview of the courses can be found in the current course catalogue. Requirements for Participation
Formal None
Content Basic knowledge of astronomy/astrophysics will be expected
Preparation None

Learning Outcomes
After successfully completing the module, the students

- have learned to apply physical knowledge from different fields (such as plasma and quantum physics) to the often 'exotic' conditions of space compared to Earth.
- Have gained a basic understanding of the most important physical processes describing the different phenomena in the universe
- know the basic theoretical concepts of modern astronomy and astrophysics
- are informed about current astrophysical issues
- can read, understand and classify astrophysical literature
- can write their Master's thesis in the field of experimental or theoretical astronomy / astrophysics

Contents
Modern astrophysical topics are introduced. In the process, the students are taken to the 'front line of research'. This is done with special emphasis on the research focus of the participating chairs and working groups in experimental and theoretical astrophysics/astronomy, but a broad overview is also provided. Extragalactic astronomy, up to (observational) cosmology and astroparticle physics, takes up a large amount of space. Interactions of different components (such as phases of the inter- stellar medium, galactic disk / halo or galaxies / intergalactic medium) are of particular importance. But also processes in our own Milky Way are presented in detail. Here, the focus is on the gas and dust components of the Milky Way and the formation of stars and linked to these planetary systems, but also on solar-terrestrial relationships, such as the physics of the solar wind. Close relations exist with plasma physics and nuclear and particle physics.

Format of Teaching Lecture, Exercises, Seminar, Laboratory Work

Format of Examination Oral examination of 45 minutes

Requirements for the Attribution of Credit Points Passing the oral examination. The focus module must include: advanced laboratory courses (5 CP) and a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved.
Use of the Module Compulsory-Elective Module
Importance of the Mark for the final grade Weighed according to Credit Points
Module Supervisor Prof. Dr. Bomans, Prof. Dr. Franckowiak
Examiners Prof. Dr. Bomans, Prof. Dr. Franckowiak, Prof. Dr. Hildebrandt, Prof. Dr. Riseley, Prof. Dr. Tjus, PD Dr. Fichtner
Further Information For advice and coordination of the courses, please contact the module supervisor.

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Cosmology b) Exercises for Cosmology	a) 33 h b) 11 h	76 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content Introduction to Astrophysics
Preparation Prior successful participation in an astronomy introductory lecture

Learning Outcomes
After successful completion of the module, students

- understand the properties of a homogeneous, isotropic universe
- are aware of the physics of the thermal history of the universe
- know the physical concepts of cosmic structure formation and the cosmic microwave background
- are familiar with the basics of the inflationary universe, reionisation, gravitational lensing and galaxy evolution
- are ready to work on a master thesis with a cosmological topic

Contents
The lecture starts with a description of the physics of homogeneous, isotropic universes, a.k.a. Friedmann-Lemaitre-Robertson-Walker universes. Their contents, past and future evolution, and observational avenues to constrain such models are discussed. Starting from the hot big bang, the thermal history of the universe is covered, connecting insights from particle physics, thermodynamics, and the above mentioned homogeneous, isotropic world models. Next, structure formation and evolution are discussed, starting from tiny primordial fluctuations all the way to the structures we see in the universe today. The cosmic microwave background (CMB) is introduced and understood based on these concepts. Cosmic inflation, reionisation, gravitational lensing and galaxy evolution are covered, always with a focus on connecting theoretical cosmology with observations.

Format of Teaching Lecture, Exercises

Format of Examination Oral exam

Requirements for the Attribution of Credit Points Active participation in the exercises and successful completion of the oral exam

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Hildebrandt

Further Information

Crossing the Desert (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	90 h	from 1. Sem.	Winter & Summer not in Summer 26	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Crossing the Desert	a) 22 h	68 h	a) Unlimited

Requirements for Participation

Formal None

Content Knowledge from "Introduction to Nuclear and Particle Physics" as well as "Astroparticle Physics"

Preparation None

Learning Outcomes

After successful completion of the module

- students can work on topics from astroparticle physics independently
- students can receive and understand specialist articles from scientists from the international research landscape
- students can lead a technical discussion on topics of particle physics beyond the Standard Model

Contents

The seminar deals with sub-areas of research in the field of neutrino and gamma astronomy and related fields such as cosmology and particle physics. Methods of analysing the large amounts of data generated in this field can also be covered.

Format of Teaching Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Active participation and presentation

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Rhode

Further information Block event, purely digital for Bochum and Dortmund, Course offered by TU Dortmund with RUB participation

Introduction to Space Physics

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Space Physics b) Exercises for Introduction to Space Physics	a) 22 h b) 11 h	57 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content Basic knowledge of Theoretical Physics
Preparation None

Learning Outcomes
After successful completion of the module

- students have a basic understanding of Space Physics
- students are aware of the capabilities of the corresponding mathematization and of the modelling
- students know the basic concepts for the quantitative description of space physical processes and systems and can apply them successfully
- students can recognize connections between space physics and astrophysics and plasma physics

Contents
Methods and results of space physics will be presented for selected space physical systems and will be discussed in the context of current research. Focus areas will be selected from the following topics: the Sun, the quiet and disturbed solar wind and its interaction with the terrestrial environment (magnetosphere as well as the interstellar medium (heliosphere), waves and turbulence in the solar wind, transport of energetic particles, space weather

Format of Teaching Lectures and exercises

Format of Examination At the beginning of the course the lecturer defines the type of exam (e.g., written exam of 45 min duration, oral exam of 30 min duration, or several shorter (multiple choice) tests during the lecture period).

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral exam or obtaining at least 50% of the possible points in the weekly exercise tasks. In this case, active participation in the exercise is also mandatory. The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor PD Dr. Fichtner

Further information

Modelling Transport and Interactions of Cosmic Rays

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group size
a) Lecture Modelling Transport and Interactions of Cosmic Rays b) Exercises for Modelling Transport and Interactions of Cosmic Rays	a) 22 h b) 11 h	57 h	a) 20 b) 20

Requirements for Participation
Formal None
Content Knowledge in one or more of the following programming languages Python, C++, and Fortran are useful and recommended.
Preparation None

Learning Outcomes
During this course, the students will:

- get familiar with different methods to model the transport and interaction of cosmic rays
- understand advantages and disadvantages of different modelling concepts based on the physics problems
- develop experience to set up and run various software tools to model CR transport
- learn to transfer simulation outputs into physical quantities
- gain basic knowledge to optimize the simulation models based on measurements of CR observables

Contents

- Ultrahigh-energy cosmic rays: Single particle propagation and efficient nuclei-photon inter- action modelling
- Galactic cosmic rays: Complex magnetic field models (coherent + turbulent), ensemble aver- aged transport (grid based and stochastic differential equations), nuclei-nuclei interaction
- Source physics: Non-linear time evolution of energy spectra, tabulated interaction rates, matrix methods
- From simulation to physics values: Re-weighting, normalization, comparison with observables

Format of Teaching Lecture, Exercises

Format of Examination The lecturer defines the kind of examination (90 min written exam, 45 min oral exam or weekly homework including active participation) at the beginning of the course.

Requirements for the Attribution of Credit Points Depending on the kind of examination: Passing the written/oral exam or reaching at least 50 % of the possible points in the (bi-)weekly homework assignments. In the latter case, active participation in the exercise group is mandatory, too. The form of examination will be defined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Dr. Merten, Prof. Dr. Tjus

Further Information

Radio Astronomy

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Radio Astronomy	a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation Introduction to Astrophysics and a good understanding of Fourier Transforms

Learning Outcomes
After successful completion of the module

- students have a basic understanding of radio astronomical imaging techniques
- Students are aware of the capabilities of modern radio telescopes and receivers
- students know the basic concepts of emission and absorption mechanisms of astronomical bodies radiating in the radio regime
- are familiar with radio astronomical polarisation measurements
- Students can recognize connections between plasma physics, high energy particle physics and radio astronomy
- students can perform their Master Thesis within the area of radio astronomy

Contents
The first half of the lecture will introduce students to the technical part of radio astronomy such as receiver and correlator technology and explain the mathematical principles needed for generating interferometric radio images. Data calibration methods will be illustrated and imaging algorithms introduced as well as methods to analyse radio interferometric data products.
The second half of the lecture gives an overview of the astronomical science radio astronomy is mostly associated with such as magnetic fields, star-formation, active supermassive galactic nuclei and time domain radio astronomy.

Format of Teaching Lecture

Format of Examination Oral exam 45 min

Requirements for the Attribution of Credit Points Passing the oral exam

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Riseley

Further information

Research Topics in Heliophysics (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Research Topics in Heliophysics	a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successful completion of the module

- students will have an overview of the research topics currently being investigated in the heliophysics group
- students will have presented their own ongoing work (resulting in a B.Sc., M.Sc., or Ph.D. thesis) to the other group members
- students will have learned to make an oral presentation of their current work to a specialized audience
- students can summarize, to comprehensively present, and critically discuss the motivation, methodology and results of their work

Contents
In a series of talks by B.Sc., M.Sc., or PhD: students they present the motivations, methods and results of their thesis-related work on helio- and astrophysical topics. Thereby focused scientific discussions are triggered that help the presenter to improve her/his work and give the specialized audience an overview over other heliophysical and related astrophysical topics.

Format of Teaching Seminar

Format of Examination Oral presentation

Requirements for the Attribution of Credit Points Oral presentation

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Selected Topics of Astronomy (Seminar)					
	Credits 2 CP	**Workload** 60 h	**Semester** from 1. Sem.	**Cycle** Winter & Summer	**Duration** 1 Semester
Courses a) Seminar Selected Topics of Astronomy			**Contact Hours** a) 22 h	**Self-Study** 38 h	**Group Size** a) Unlimited

Requirements for Participation
Formal Yes
Content Yes
Preparation Solid knowledge of the foundations of Astronomy is needed, as presented in the lecture „Grundlagen der Astronomie" and attendance of the lecture „Introduction to Astrophysics" highly recommended. Previous attendance of more specialized Astronomy/Astrophysics lectures is recommended but not required.

Learning Outcomes
The seminar is intended to give the students exposure to cutting edge Astronomical/Astrophysical science topics, train the understanding of research papers, the presentation of science results at the knowledge level of their fellow students, and discuss them following each of the presentations. (This requires participation in at least most of the seminar dates.)

Contents
In the seminar the students select from a list of topical papers the one to present. The topics are selected by the full-time lecturers and therefore reflect mostly the work topics actively pursued at the Astronomical Institute. With help from the respective advisors the students prepare the topics to be presented in their seminar talk and are provided with help for the actual presentation. Result of presenting one talk, plus listening and discussing the other talks of the seminar will provide a view of some topical research in Astronomy/Astrophysics.

Format of Teaching Seminar

Format of Examination Oral presentation and activity in the discussions after the talk

Requirements for the Attribution of Credit Points Successful presentation of the seminar talk and active participation

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisors and Instructors Prof. Dr. Bomans, Prof. Dr. Franckowiak, Prof. Dr. Hildebrandt Prof. Dr. Riseley

Further information

Stars, Wind, Nebulae

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Stars, Wind Nebulae	a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation Basic knowledge in astronomy (e.g. Introduction to Astronomy course) necessary

Learning Outcomes
Students will get a broader view on the stellar evolution and consequences of mass loss. Mainly from an observational perspective but also theoretical concepts are introduced and discussed.

Contents
The course concentrates on stellar evolution of stars of all masses. A focus is given on the parameters that influence the evolution – in particular the stellar mass loss and its consequences. The lecture addresses the topic from an observational point of view, but also theoretical models presented. Besides observational characteristics, also the mechanism of stellar winds is addressed. The formation of circumstellar nebula from stellar winds and possible shell ejections is another topic of the lecture. In this context the lecture briefly tackles several concepts and properties of the Interstellar medium.

Format of Teaching Lecture

Format of Examination Possible are an oral exam, a short oral presentation or written essay

Requirements for the Attribution of Credit Points Active participation and a successful examination

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor PD Dr. Weis

Further information

The Milky Way and External Galaxies

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture The Milky Way and External Galaxies	a) 33 h	57 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation Solid knowledge of the foundations of Astronomy is necessary, as it is presented in the lecture „Grundlagen der Astronomie“. Previous attendance of the lecture „Introduction to Astrophysics“ is helpful but not required.

Learning Outcomes
After the successful completion of the course students will have gained a deeper understanding of structure, kinematics, and evolution of our Milky Way galaxy. Using these concepts, in the second part of the lecture the properties and evolution of external galaxies will be explored and a coherent picture for evolution of galaxies inside the evolving universe will be derived.

Contents
The course consists of two major parts: the exploration of the physical properties of our Milky Galaxy and the extension to the various types of external galaxies, both the underlining goal to derive a consistent picture for the evolution of galaxies from the early universe to today. Methods and results for the structure, kinematics, star formation history, and chemical evolution will be presented and applied to the different galaxy types and conclusions for the evolution of the galaxy types derived.

Format of Teaching Lecture

Format of Examination Usually a short oral presentation, alternatively (if special conditions apply) a written essay or an oral exam

Requirements for the Attribution of Credit Points Active participation and a successful examination

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Theoretical Heliophysics (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter & Summer not in Summer 26	1 Semester
Courses a) Seminar Theoretical Heliophysics			**Contact Hours** a) 22 h	**Self-Study** 38 h	**Group Size** a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successful completion of the module

- students will have basic insight into selected topics of contemporary heliophysical research
- students will have familiarized themselves with one topic in more detail based on one or more research publication(s)
- students will have learned to make an oral presentation of a chosen scientific problem to an interested audience
- students can extract, to summarize, and to critically discuss the essence of a given research paper

Contents
In a series of student presentations methods and results of various heliophysical and related astro- physical studies are critically discussed. Thereby an introduction into theoretical heliophysics is provided based on topics that are in the focus of current research activities. Besides the scientific content, it is also conveyed how a scientific presentation should be structured and made.

Format of Teaching Seminar

Format of Examination The oral presentation (or, in exceptional cases, the term paper) will be evaluated

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral exam or obtaining at least 50% of the possible points in the weekly exercise tasks. In this case, active participation in the exercise is also mandatory. The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Modul 3b Biophysics

	Credits	Workload	Semester	Cycle	Duration
	15-25 CP	450-750 h	1.-2. Sem.	Winter & Summer	2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture b) Exercises c) Seminar (at least 2 CP) d) Advanced Laboratory Courses (at least 5 CP) A complete overview of the courses can be found in the current course catalogue. The CP of the individual courses results from the semester hours per week (1 hour per semester week = 1 CP).	Each at least. a) 44 h b) 44 h c) 22 h d) 35 h	min. 309 h	a) unlimited b) 30 c) 30 d) 2

Requirements for Participation
Formal None
Content Knowledge from "Introduction to Biophysics" will be expected
Preparation none

Learning Outcomes
After successfully completing the module, the students
- re familiar with the molecular biological processes as well as the physical methods of investigation and can use these to describe equilibria and reactions
- have a deeper insight into current research topics in molecular biophysics at the Ruhr-University Bochum
- can work out scientific contents, theories and methods independently and to communicate them confidently orally and in writing
- can independently find and use information in the relevant databases
- are proficient in analysing data on protein sequence and structure with suitable programmes.

Contents
Structural resolution methods, X-ray crystallography, energy refinement, modelling,
Force fields, molecular dynamics simulation, QM/MM simulation, FTIR and Raman scattering, spectroscopy applied to current problems, bioinformatics.

Format of Teaching Lecture, Exercises, Seminar, Laboratory Work

Format of Examination Oral examination of 45 minutes

Requirements for the Attribution of Credit Points Passing the oral examination.
The focus module must include: advanced laboratory courses (5 CP), a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved. Achievements made after the final module examination no longer count towards the module.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Preparation None

Learning Outcomes:
After successful completion of the module, students will have
- gained an overview of current methodological developments and their applications in the field of theoretical biophysics and structural bioinformatics.
- a basic understanding of how to critically evaluate and present literature.
- acquired the basic concepts for a good literature presentation.

Contents
During the seminar, literature on current applications and methodological developments in the field of theoretical biophysics and structural bioinformatics will be presented and discussed.

Format of Teaching Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Active participation in the seminar events (>75%) and an own literature presentation.

Use of the Module Courses in Focus Area

Modul 3c Nuclear and Particle Physics

	Credits	Workload	Semester	Cycle	Duration
	15-25 CP	450-750 h	1.-2. Sem.	Winter & Summer	2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture b) Exercises c) Seminar (at least 2 CP) d) Advanced Laboratory Courses (at least 5 CP) A complete overview of the courses can be found in the current course catalogue. The CP of the individual courses results from the semester hours per week (1 hour per semester week = 1 CP).	Each at least. a) 44 h b) 44 h c) 22 h d) 35 h	min. 309 h	a) unlimited b) 30 c) 30 d) 2

Requirements for Participation
Formal None
Content Knowledge from “Introduction to Nuclear and Particle Physics” will be expected
Preparation None

Learning Outcomes
After successfully completing the module, the students

- understand both how the Standard Model of particle physics was developed and its predictive power
- can make the connection between quantum field theory predictions and experiments
- have a deeper understanding of the electromagnetic, weak and strong interactions
- are familiar with and can interpret Nobel Prize experiments in nuclear and particle physics
- can make the connection between symmetries and experimental observations
- possess a knowledge of open questions and current research topics in the field of nuclear and particle physics
- can explain the connection between particle physics and the development of the universe

Contents
Dirac equation, spin, antiparticles, conservation laws, Feynman diagrams, Yukawa interaction, strangeness, group theory and symmetry, Clebsch-Gordon coefficients, meson nonets, Breit-Wigner resonances, colours in QCD, charm, confinement, Global and local symmetries, hadron structure, parton model, deep inelastic scattering and scale behaviour, neutrino physics, weak WW, mixing states, Higgs mechanism of mass production, physics beyond the Standard Model, quantum field theories, solitons. In addition, special events are offered in the form of lectures and seminars on detectors, hadron physics, neutrino physics, as well as theoretical nuclear and particle physics or other current topics. Practical experiments complement theoretical knowledge.

Format of Teaching Lecture, Exercises, Seminar, Laboratory Work

Format of Examination Oral examination of 45 minutes

Requirements for the Attribution of Credit Points Passing the oral examination. The focus module must include: advanced laboratory courses (5 CP), a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved. Achievements made after the final module examination no longer count towards the module.

Learning Outcomes
After successfully completing the module, the students
- are familiar with the basics of the Standard Model of particle physics, its successes and shortcomings as well as current research topics in particle physics
- Students have a deeper understanding of the scientific issues in the chosen focus area.
- students have experience in preparing and giving a scientific presentation.

Contents
The course deals with the fundamentals of the Standard Model and covers topics such as quantum chromodynamics, theory of the electroweak interaction, anomalies, QCD methods, precision tests of the Standard Model, neutrino physics, physics beyond the Standard Model, etc.
The seminar serves the elaboration of a concrete topic. At the beginning of the seminar, different topics will be handed out by the supervisors and briefly discussed. Within the seminar series, individual topics are developed and presented.

Format of Teaching Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Active participation in the sessions, presentation

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Data Analysis in High Energy Physics

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Data Analysis in High Energy Physics b) Exercises to Data Analysis in High Energy Physics	a) 22 h b) 11 h	a) 38 h b) 19 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content Proficiency in calculus and basic programming skills are recommended.
Preparation None

Learning Outcomes
After successfully completing the module, the students will be able to:

- understand the role and importance of data analysis in high-energy physics experiments
- apply basic and advanced statistical methods to particle physics data
- perform parameter estimation and hypothesis testing using real experimental data
- analyse and interpret uncertainties in experimental measurements
- utilize machine learning techniques for classification of particle reactions
- fit theoretical models to experimental data and evaluate quality of the fit
- gain hands-on experience with LHCb data and particle-physics analysis tools
- learn basics of Julia programming language
- complete an independent data analysis project, demonstrating the application of learned techniques
- present and effectively communicate analysis results to peers.

Contents
This course provides a comprehensive journey from statistical modelling to advanced data analysis techniques, incorporating elements of modern research workflows in particle physics. Students will learn core topics such as probability distributions, parameter estimation, hypothesis testing, uncertainty analysis, multivariate techniques, and machine learning for particle classification, alongside model fitting and evaluation. Weekly lectures will be followed by hands-on application to a freshly collected dataset from the LHCb experiment in 2024. Students will progressively build their skills by analysing real research data, fitting theoretical models, and interpreting uncertainties. The course also introduces Julia programming to equip students with modern computational tools. Bi-weekly tutorials will serve as hackathon-style workshops, providing direct support for advancing coding projects and preparing for upcoming tasks. By the end, students will complete an independent data analysis project and present their findings, demonstrating their proficiency in high-energy physics data analysis.

Format of Teaching Lecture, Exercises

Format of Examination Presentation of results of the data analysis project developed during the semester.

Requirements for the Attribution of Credit Points Active participation (> 75 %) the exercise, obtaining at least 50% of the possible points in the weekly exercises.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Mikhasenko

Detectors for Particle Physics (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Detectors for Particle Physics	a) 22 h	38 h	a) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
Students will
- Study individual subdetectors for subatomic particles
- Learn how complete detector systems are composed from subdetectors
- Understand the limitations of detectors
- Get acquainted with modern electronics and data acquisition systems
- Understand the interplay between physics goals and tailored experiments.

Contents
Detectors for charged and neutral particles with their advantages and drawbacks. The relevance of electronics and data acquisition systems for composed detector systems. The interplay between the source of subatomic particles and the design of a complete detector system tailored to very specific physics goals. Multipurpose detector systems at accelerators and their achievements.

Format of Teaching Seminar talks by the students

Format of Examination Preparation and subsequent presentation of a seminar talk to the whole group.

Requirements for the Attribution of Credit Points Independent preparation of a seminar talk about particle detectors and their physics goals. Clear and comprehensive presentation of the material to the seminar participants.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Wiedner

Effective Field Theories (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Effective Field Theories	a) 22 h	38 h	a) 30

Requirements for Participation:
Formal None
Content Successful participation in the course Advanced Quantum Mechanics; participation in the lectures Quantum Field Theory I and/or Introduction to Theoretical Hadron Physics will be advantageous.
Preparation None

Learning Outcomes
After successfully completing the module, the students

- are familiar with the basics of effective field theories and their applications in nuclear and particle physics.
- Students have a deeper understanding of the scientific issues in the chosen focus area.
- students have experience in preparing and giving a scientific presentation.

Contents
The course deals with the basics of the theoretical methodology of effective field theories (EFT), which find wide application in almost all areas of physics. Topics include the interpretation of the Standard Model as EFT, pionless and chiral EFT, renormalisation and renormalisation group equation, EFT for the treatment of halo nuclei, EFT for BSM physics, EFT of gravity, etc.

The seminar is designed to work on a specific topic. At the beginning of the seminar, different topics are handed out by the supervisors and briefly discussed. Within the seminar series, individual topics are developed and presented.

Format of Teaching Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Active participation in the sessions, presentation

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Experimental Methods in Nuclear and Particle Physics	a) 22 h	38 h	a) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
Students will
- get acquainted with certain physics topics in nuclear and particle physics
- present the underlying theoretical concepts
- learn the interpretation of experimental data
- have a basic knowledge of nuclear and particle physics
- be aware of the precision of measurements and the question of statistics

Contents
Strong and weak interactions. Heavy ion and neutrino physics. Quantum field theory as underlying theoretical concept. Statistical interpretation of data.

Format of Teaching Seminar talks by the students.

Format of Examination Preparation and subsequent presentation of a seminar talk to the whole group.

Requirements for the Attribution of Credit Points Independent preparation of a seminar talk about particle detectors and their physics goals. Clear and comprehensive presentation of the material to the seminar participants.

Hadron Physics

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Hadron Physics b) Exercise for Hadron Physics	a) 22 h b) 22 h	76 h	a) unlimited b) 30

Requirements for Participation
Formal None
Content Prior completion of undergraduate-level courses in quantum mechanics, classical mechanics, and electromagnetism. Basic coursework in particle and nuclear physics is recommended.
Preparation Proficiency in calculus and basic programming skills are needed to effectively engage with the quantitative aspects of the course.

Learning Outcomes
After successful completion of the course, students will be able to

- demonstrate a solid understanding of the fundamental principles of QCD and its relation to the Quark Model (QM)
- describe the classification of hadrons, relation between flavour multiplets in Qm
- understand and discuss analysis of mass spectrum using reaction theory, characterize hadronic resonances and relate them to properties of particles
- develop skills in data analysis, including event generation and filtering
- gain insights into exotic hadrons like tetraquarks, pentaquarks, hybrid and glueballs
- follow discussions on application of effective field theories and computational methods (lattice QCD) in hadron physics
- identify current and future experiments in hadron physics, and understand the role in the broader context of particle physics
- identify potential research projects and opportunities for internships

Contents
This course in Hadron Physics is an extensive program designed to provide students with a fundamental and practical understanding of Quantum Chronodynamics (QCD) in a confined regime of hadronic matter. Beginning with the introduction to the basics of QCD, including quarks, gluons, colour confinement, asymptotic freedom, and gauge invariance, the course sets a solid theoretical foundation. It then progresses into a detailed study of hadron classification and structure, covering baryons, mesons, the quark model, and flavour symmetry. A significant portion of the course is de- voted to experimental techniques in hadron physics, with a focus on particle detectors, and data processing, particularly LHCb, COMPASS, and BES experiments. This includes practical aspects of event generation, detection, and data analysis, alongside addressing common experimental challenges. Spectral analysis and reaction theory are explored, elucidating particle interaction, resonance phenomena. Students will also delve into the spectroscopy of hadrons, learning about excitation spectra of mesons and baryons, as well as exotic structures like tetraquarks, pentaquarks, glueballs, and hybrids. Theoretical tools and computational methods will be discussed in the second half of the course. The course also addresses current and future experiments in hadron physics, exploring their role in the broader context of particle physics and discussing heavy flavour physics, including heavy quarks, CP violation, and B-meson physics. Finally, the course wraps up with ethical and practical considerations in research, offering guidance on collaboration in large-scale experiments, student projects, research opportunities, and career paths in hadron physics.

Format of Teaching Lecture, exercises

Format of Examination An oral examination based on a demonstration of the solution to a problem

Requirements for the Attribution of Credit Points Active participation (> 50 %) in exercise classes, presentation of the homework problem at the board at least two times during the semester, oral exam of 30 minutes based on a problem communicated a week before the exam. The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area
Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Hadrons at Large Hadron Collider (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter & Summer not in Summer 26	1 Semester
Courses a) Seminar Hadrons at Large Hadron Collider			**Contact Hours** a) 22 h	**Self-Study** 76 h	**Group Size** a) Unlimited

Requirements for Participation
Formal None
Content Basic coursework in particle and nuclear physics is recommended.
Preparation None

Learning Outcomes
After successful completion of the course, students will be able to:
- Gain an overview of state-of-the-art research topics related to studies of hadrons and their interactions at LHC
- Develop the ability to effectively present scientific research to a group of experts.
- Learn to actively participate in and contribute to scientific discussions

Contents
In this seminar, students are assigned a specific topic related to hadrons physics at Large Hadron Collider. Throughout the semester, they conduct an in-depth study of their topic following recent scientific publications. The first half of the course is dedicated to independent research, while students receive guidance and feedback from the instructor. In the second half, students present their findings to the group in a series of scientific presentations. These sessions are followed by open discussions.

Format of Teaching Seminar

Format of Examination The student performs a talk of 45-90 min. plus discussion within the research group

Requirements for the Attribution of Credit Points Active participation (> 75 %) and successful talk with valid discussion

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Introduction to Nuclear and Particle Physics II

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Nuclear and Particle Physics II b) Exercises for Introduction to Nuclear and Particle Physics II	a) 33 h b) 11 h	76 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content Introduction to Nuclear and Particle Physics is recommended
Preparation None

Learning Outcomes
After successful completion of the module

- understand the historical development of particle physics through its key experimental discoveries;
- are familiar with the basic concepts and methods of the field, including relativistic kinematics, decay rates, and scattering cross sections;
- can explain how decisive experiments established the particle content and interaction structure of the Standard Model;
- can describe the experimental basis of topics such as the quark-parton picture, weak interactions, neutrino physics, and CP violation;
- can relate experimental results to their physical interpretation within the modern framework of particle physics.

Contents
This course presents particle physics through its experimental foundations and follows the historical development of the field through the key discoveries that shaped our present understanding of elementary particles and their interactions. It discusses the central physics concepts and findings that emerged from decisive experiments and examines selected original papers that marked important steps in the development of particle physics. The course emphasizes the interplay between experimental evidence and physical interpretation, showing how new phenomena were identified and how the growing body of results led to an increasingly deep understanding of the structure of matter and the fundamental forces.

Format of Teaching Lectures, exercises

Format of Examination An oral examination based on a demonstrating the solution to a problem.

Requirements for the Attribution of Credit Points
Active participation in the exercises and successful completion of the oral exam, participation at least 50% of exercises gives an admission to the exam.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Mikhasenko

Lattice Field Theory

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Summer not in Summer 26	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture "Introduction to Lattice Field Theory" b) Exercises "Introduction to Lattice Field Theory"	a) 44 h b) 22 h	114 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successful completion of the module, students

- have a basic understanding of the lattice regularization of quantum field theory, as well as application of the Markov chain Monte Carlo method
- are aware of the commonly used discretisation of QCD, as well as modern simulation algorithms
- know the theory of renormalisation and the elimination of leading cutoff effects
- are familiar with analysis techniques to determine hadron masses and matrix elements from simulation data
- can interpret statistical and systematic errors in lattice QCD computations associated with the finite lattice spacing and simulation volume

Contents
Review of continuum field theory, in particular Quantum Chromodynamics; Lattice regularisation of bosonic fields; the Fermion doubling problem and its solutions; the Symanzik improvement program; Chiral symmetry and associated Ward identities; Heatbath algorithm for pure gauge theory; Hybrid Monte Carlo algorithm for QCD; Multigrid inversion methods for the Dirac operator; Autocorrelation; Observables and Correlation functions; Real-time phenomena

Format of Teaching Lecture, exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written exam of 45 min, oral exam of 45 min or project work)

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written exam, the oral exam or successful project work

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Courses	Contact Hours	Self-Study	Group Size
c) Lecture Nucleosynthesis in Nuclear Astrophysics d) Exercises for Nucleosynthesis in Nuclear Astrophysics	c) 22 h d) 22 h	76 h	10

Requirements for Participation
Formal None
Content Basic knowledge of nuclear physics.
Preparation None

Learning Outcomes
After successful completion of the module, students are familiar with

- the standard model of cosmology
- the evolution of stars depending on their mass
- the different production mechanisms of elementary particles in the different mass ranges
- the features of neutrinos

Contents
The lecture will start with an introduction into nuclear physics to provide the basic knowledge needed for the rest of the lecture. It will continue with a description of the big band and the big bang nucleosynthesis where the lightest elements are created. The next part of the lecture will describe the fusion processes in stars and their evolution which leads to the creation of more heavier elements up to iron. The third topic covers the creation of the more heavy elements via various processes in supernovae and neutron star merges. The last part of the lecture covers our recent knowledge of neutrinos and their features.

Format of Teaching Lecture, exercises

Format of Examination Presentation about a topic selected at the beginning of the lecture

Requirements for the Attribution of Credit Points Successful presentation of a topic in a 25 – 30 minutes presentation and Active participation (>75 %) in the lecture.

Use of the Module Courses in Focus Area

Courses a) Seminar Selected Topics of Hadron Physics			**Contact Hours** a) 22 h	**Self-Study** 38 h	**Group Size** a) 30

Requirements for Participation:

Formal None

Content The seminar is aimed at Master and PhD students who are already familiar with the basics of quantum field theory, effective field theories and hadron physics.

Preparation None

Learning Outcomes

After successfully completing the module, the students

- have an overview of the current research directions and questions in the field of theoretical hadron physics.
- have experience in preparing and giving a scientific presentation.

Contents

The event deals with current developments in hadron physics. External experts are increasingly invited to provide the broadest possible overview of the research topics. Lectures are accompanied by intensive technical discussions and offer the opportunity to exchange ideas with the speakers. Scientific staff from the Department of Theoretical Hadron Physics also take part in the event.

The participating students and doctoral candidates can present their latest results and receive feedback.

Format of Teaching Seminar

Format of Examination Presentation

Modul 3d Plasma Physics

	Credits	Workload	Semester	Cycle	Duration
	15-25 CP	450-750 h	1.-2. Sem.	Winter & Summer	2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture b) Exercises c) Seminar (at least 2 CP) d) Advanced Laboratory Courses (at least 5 CP) A complete overview of the courses can be found in the current course catalogue. The CP of the individual courses results from the semester hours per week (1 hour per semester week = 1 CP).	Each at least. a) 44 h b) 44 h c) 22 h d) 35 h	min. 309 h	a) unlimited b) 30 c) 30 d) 2

Requirements for Participation

Formal None

Content Basic knowledge of plasma physics will be expected

Preparation None

Learning Outcomes

After successfully completing the module, the students

- have a basic understanding of the important methods of plasma generation and the heating mechanisms of plasma
- are familiar with important diagnostic methods of plasma
- have a deepened understanding of the theoretical concepts to describe plasma in different scales of time and space
- can apply methods of measurement of plasma
- know different fields of application of plasma, like interaction with biological systems or with surfaces of fusion experiments

Contents

Plasma generation; plasma heating; plasma diagnostics; physics of the plasma boundary layer; plasma-surface interaction; plasma chemistry, plasma deposition, plasma etching; waves in plasmas, etc.

Format of Teaching Lecture, Exercises, Seminar, Laboratory Work

Format of Examination Oral examination of 45 minutes

Requirements for the Attribution of Credit Points Passing the oral examination. The focus module must include: advanced laboratory courses (5 CP), a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved. Achievements made after the final module examination no longer count towards the module.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor Prof. Dr. Innocenti, Prof. Dr. van Helden

Examiner Prof. Dr. Czarnetzki, Prof. Dr. Golda, Prof. Dr. Grauer, Prof. Dr. Innocenti, Prof. Dr. van Helden, Prof. Dr. von Keudell, Prof. Dr. Tjus, PD Dr. Fichtner

Fokker-Planck and Boltzmann Kinetics in Plasmas (Seminar)

	Credits	Workload	Semester	Turnus	Duration
	2 CP	60 h	1./2. Sem.	summer	1 semester

Courses	contact time	self-study time	Group size
a) Seminar Fokker-Planck and Boltzmann Kinetics in Plasmas"	a) 22	38 h	a) Unlimited b) 30 c) 30

Participation requirements
Formal: none
Content: Introduction to Plasma Physics
Preparation: none

Learning outcomes
After successful completion of the module students
- Have a basic understanding of kinetic and statistical methods in plasma physics
- Are aware of possibilities related to non-local and resonant effects
- Know the basic concepts of statistical description of plasmas
- Are familiar with the respective physical concepts and mathematical methods
- Can recognize the relation between temporal and spatial structures and their consequences for heating and transport

Content
Plasmas are many particle systems and, therefore, many phenomena cannot be described by the common fluid picture. In the course, the standard description by the Boltzmann equation is revisited in detail but a strong focus will be also on alternative statistical concepts like the master equation, the Fokker-Planck equation and the Langevin equation. The concepts are derived from first principles and are then applied to describe basic plasma phenomena. These include, among others, electron Landau damping, local and non-local electron heating in ICPs. Mathematical methods as well as physical pictures and concepts are introduced. The theoretical concepts are complimented by experimental results.

Teaching forms seminar

Form of examination Successful presentation of a seminar talk on a selected subtopic.

Requirements for the award of credit points
Seminar talk and regular participation in the seminar

Use of the module Courses in Focus area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Introduction to Plasma Physics II

	Credits	Workload	Semester	Cycle	Duration
	5 CP	120 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Introduction to Plasma Physics II b) Exercises for Introduction to Plasma Physics II	a) 22 h b) 22 h	76 h	a) unlimited b) 30

Requirements for Participation
Formal None
Content None
Preparation Basic knowledge in the field of plasma physics, e.g. through the lecture "Introduction to Plasma Physics I" desirable but not mandatory.

Learning Outcomes
After successful completion of the module
1. students have a basic understanding of the essential characteristics of a low-temperature plasma
2. students know the heating methods and ignition phenomena of a plasma
3. students can assess the main fields of applications of low-temperature plasmas

Contents
1. Introduction: Overview of low-pressure plasmas, plasmas and their surface layers, plasma models, electrotechnical description
2. Generation of a plasma: ionization, swarm experiments, ignition of a plasma volume vs. surface mechanisms, ignition phenomena, sprites
3. Maintaining a Plasma: Ohmic Heating, Stochastic Heating, Wave Heating, Global Model for describing Plasmas, Electronegative Plasmas
4. Low pressure Plasmas: DC, RF, ECR, Magnetron, HPPMS
5. Atmospheric pressure plasmas: corona, DBD, microplasmas

Format of Teaching Lecture, Exercise

Format of Examination At the beginning of the course, the lecturer determines the form of examination (oral examination of 30 minutes or active participation in the exercises) for the lecture.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the exam/oral exam or obtaining at least 50% of the possible points in the weekly exercises. In addition, in this case, active participation in the exercise is mandatory. The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area

Modelling of Atomic Populations in the Spectroscopy of Laboratory and Astrophysical Plasmas II

	Credits 4 CP	Workload 120 h	Semester from 1. Sem.	Cycle Summer	Duration 1 Semester
Courses a) Lecture Modelling of Atomic Populations in the Spectroscopy of Laboratory and Astrophysical Plasmas II b) Exercises for Modelling of Atomic Populations in the Spectroscopy of Laboratory and Astrophysical Plasmas II			**Contact Hours** a) 22 h b) 22 h	**Self-Study** 76 h	**Group Size** a) unlimited b) 30

Requirements for Participation

Formal None
Content None
Preparation None

Learning Outcomes
After successfully completing the module, the students

- have a basic understanding of atomic processes relevant to spectroscopic investigations in laboratory and astrophysical plasma
- are aware of the possibilities of applying numerical methods in other areas of astrophysics and plasma physics.
- are familiar with the basic concepts of the Stroß radiation models and describe the important interrelationships of plasma spectroscopy.
- are familiar with modern methods of plasma spectroscopy as well as on-line tools like FLYCHK (https://nlte.nist.gov/FLY/) or atomic and spectroscopic database (https://physics.nist.gov/PhysRefData/ASD/lines_form.html)
- can recognise connections between atomic and plasma physics and apply them to different spectroscopic observations

Contents
The lecture summarises the basics of the atomic models of plasma spectroscopy. First, relevant topics of atomic physics are explained, which are necessary for the understanding of the most important atomic processes. Previous knowledge from quantum mechanics is deepened. The most important processes are dealt with, which represent the foundation of plasma spectroscopy. Examples are taken from fusion and laboratory experiments and from astrophysics. The knowledge gained is partly supported by practical exercises using freely available atomic codes such as FLYCHK, FAC , or AUTOSTRUC-TURE, so that the listeners become familiar with the status of atomic models and can apply them to their specific problems in research if required.

Format of Teaching Lecture, Exercises

Format of Examination Oral examination of 45 minutes

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the oral examination or obtaining at least 50% of the possible points in the weekly exercise tasks. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor PD Dr. Marchuk

Modern Spectroscopy: Laser Techniques and Spectroscopic Methods

	Credits	Workload	Semester	Turnus	Duration
	2 CP	60 h	1./2. Sem.	Summer	1 Semester

Courses	contact time	self-study time	Group size
Lecture "Modern Spectroscopy: Laser Techniques and Spectroscopic Methods"	b) 22 h	38 h	d) Unlimited

Requirements for Participation
Formal: none
Content: Basic knowledge of quantum mechanics, optics, and atomic or molecular physics is recommended, but the course is designed to be accessible to students from related fields.
Preparation: none

Learning outcomes
After successful completion of the module, the students

- have a basic understanding of light-matter interactions and know the modern spectroscopic methods
- know the basic concepts of laser spectroscopy, optical cavities, frequency combs, and nonlinear optical conversion
- are familiar with applications of spectroscopy in gases, plasmas, atmospheric sensing, laboratory astrophysics, and fast physical processes
- can apply basic concepts to the interpretation of spectroscopic measurements and data analysis

Content

1. Introduction to light-matter interactions.
2. Fundamentals of laser spectroscopy, spectral broadening mechanisms, and detection limits.
3. Modern spectroscopic techniques including optical cavities, Fourier transform spectroscopy, terahertz spectroscopy, and optical frequency combs.
4. Nonlinear optical conversion and its application to spectroscopy.
5. Introduction to precision metrology concepts including atomic clocks.
6. Applications of spectroscopy in gases, plasmas, atmospheric sensing, and laboratory astrophysics.
7. Basic concepts of spectroscopic data analysis and interpretation.

Teaching forms Lecture

Form of examination Oral examination within 20 min on given topics with a focus on one or two of these topics.

Requirements for the award of credit points Passing the oral examination

Use of the module Elective module

Importance of the grade for the final grade Graded, but does not contribute to the weighted average final grade

Module coordinator/full-time lecturer Dr. Ibrahim Sadiek

Other information The lecture will be in English.

Plasma Chemistry

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Plasma Chemistry b) Exercises for Plasma Chemistry	a) 22 h b) 11 h	57 h	a) Unlimited b) 30

Requirements for Participation

Formal None
Content Introduction to Plasma Physics I + II
Preparation Introduction to Plasma Physics I + II

Learning Outcomes
After successful completion of the course
- students have a basic understanding of equilibrium and non-equilibrium processes in plasma chemistry
- are aware of the possibilities plasma interactions offer for surface modifications and material processing
- students know the basic concepts of thermodynamics, kinetics, and reaction mechanisms in plasma environments
- are familiar with the mathematical description of kinetic models for plasma reactions and transport processes
- students can recognize connections between plasma chemistry and surface reactions, and apply this knowledge to real-world applications such as plasma etching and deposition

Contents
This course introduces the fundamental principles of plasma chemistry, focusing on the interaction between plasma and chemical processes. Topics include thermodynamics, kinetics, diffusion, surface reactions, and the behavior of ions in plasma environments. By the end of this course, students will be able to understand and apply these concepts to the study and manipulation of plasma-chemical systems.

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written exam of 90 min, oral exam of 30 min or in the form of exercises with weekly homework and active participation in the exercises).

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written exam, the oral exam or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation (> 75 %) in the exercises is also mandatory. The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Golda, Prof. Dr. von Keudell

Plasma Diagnostics

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Plasma Diagnostics b) Exercises for Plasma Diagnostics	a) 22 h b) 22 h	76 h	a) 30

Requirements for Participation

Formal None
Content None
Preparation None

Learning Outcomes

After successfully passing the module, the students

- Know the most important diagnostical methods
- Know to make the appropriate choice of a diagnostical method for the measurement of defined parameters of a plasma

Contents

The lecture introduces the fundamentals of optical plasma diagnostics. The essential plasma and atomic physical concepts are introduced. The lecture begins with the presentation of measurement and analysis of electrical parameters e.g., from a probe measurement. The spectroscopic methods are explained in detail, the parameters that can be directly and indirectly derived from them, e.g., electron density and temperature, are discussed, and the respective areas of application as well as the limits of the methods are shown. Emphasis is also placed on teaching experimental methodology, i.e., the mode of operation and use of optical components and devices. Finally, in addition to the optical methods, energy-resolved mass spectroscopy for the detection of atoms, molecules and ions is also dealt with.

Format of Teaching Lecture, Exercises

Format of Examination Delivery of a coursework. The coursework can take the form of a written test or an interview with the lecturer.

Requirements for the Attribution of Credit Points Passing the examination with at least 50% of the achievable points.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Golda

Further Information

Seminar on Space Plasma Physics (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Summer (not in SoSe26)	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar on Space Plasma Physics	a) 22 h	38 h	a) unlimited

Requirements for Participation
Formal None
Content Knowledge of theoretical mechanics and electrodynamics
Preparation None

Learning Outcomes
After successfully passing the module, the students will
- have a basic understanding of plasma physics models relevant to space applications
- know fundamental parameter regimes of space plasma and their implications
- know key phenomena observed in Solar system plasmas
- have gained insight into key processes such as waves and instabilities
- be familiar with some theoretical concepts
- know fundamental methods in numerical space plasma simulation

Contents
- Short review of the description of magnetized plasmas
- Examples of plasma phenomena in space
- Formulation of theoretical models for these phenomena
- Fundamentals of numerical simulation of space plasma
- Overview of observational methods and technology

Format of Teaching Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Criteria to obtain CPs are:
i) regular and active participation in the seminar, and
ii) successful preparation and presentation of a 45 minute talk on a selected topic

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Innocenti / Dr. Dreher

Further Information

Turbulence and Transport in Fusion Plasmas

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Turbulence and Transport in Fusion Plasmas	b) 22 h	38 h	b) Unlimited

Requirements for Participation

Formal None

Content None

Preparation Previous knowledge of plasma physics is useful

Learning Outcomes

After successfully passing the module, the students will

- know the basics of gyrokinetics
- have a basic understanding of linear, quasilinear and non-linear plasma modelling
- be able to program a simple simulation code
- be familiar with important plasma instabilities and saturations
- have application skills of transport equations for the purpose of comparing theory and experiment

Contents

Linear and non-linear physics of micro-instabilities and turbulence in magnetically confined plasmas, resulting heat and particle transport in fusion reactors

Format of Teaching Lecture and project seminar

Format of Examination Project work: Development of a scientific project within one week in small groups (2-3 persons), 15-20 minutes presentation on results; assessment of content and presentation quality. If desired, individual grades from the optional oral examination can be assessed at 50%.

Requirements for the Attribution of Credit Points Passing the examination. Active participation (>50% attendance) in the group project work and presentation.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor PD Dr. Püschel

Further Information Module is taught in English

Modul 3e Solid State Physics

	Credits	Workload	Semester	Cycle	Duration
	15-25 CP	450-750 h	1.-2. Sem.	Winter & Summer	2 Semesters

Courses	Contact Hours	Self-Study	Group Size
a) Lecture b) Exercises c) Seminar (at least 2 CP) d) Advanced Laboratory Courses (at least 5 CP) A complete overview of the courses can be found in the current course catalogue. The CP of the individual courses results from the semester hours per week (1 hour per semester week = 1 CP).	Each at least. a) 44 h b) 44 h c) 22 h d) 35 h	min. 309 h	a) unlimited b) 30 c) 30 d) 2

Requirements for Participation
Formal None
Content Basic knowledge of solid state physics will be expected
Preparation none

Learning Outcomes
After successfully completing the module, the students
- have a basic understanding of the properties of the solid state, its atomic structure, and its electrical, magnetic, mechanical and optical properties
- are aware of the possibilities within the different research areas and specialisations of theoretical and experimental solid state physics
- know the basic concepts of the theoretical description of the solid state
- are familiar with basic experimental procedures for measuring solid state properties
- re able to recognise correlations between the microscopic structure of the solid body and its macroscopic properties and apply these to estimate technological usability

Contents
Deepening of knowledge in the main areas of solid state physics, especially optical, magnetic and superconducting properties. Theoretical solid state physics deals with the many-body problem and places the main areas of solid state physics on a solid quantum mechanical basis. In addition, several special lectures are offered for in-depth study: Surface Physics, Magnetism, Superconductivity, Semiconductor Physics and Semiconductor Devices, Phase Transitions, Metal Physics, Scattering Physics, Physics of Thin Films, Nanostructuring and Spintronics, and other areas in mod- ern experimental and theoretical solid state physics.

Format of Teaching Lecture, Exercises, Seminar, Laboratory Work

Format of Examination Oral examination of 45 minutes

Requirements for the Attribution of Credit Points Passing the oral examination.
The focus module must include: advanced laboratory courses (5 CP), a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved. Achievements made after the final module examination no longer count towards the module.

Use of the Module Compulsory-Elective Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor Prof. Dr. Böhmer

Examiners Prof. Dr. Böhmer, Prof. Dr. Botti, Prof. Dr. Drautz, Prof. Dr. Eremin, Prof. Dr. Hägele, Prof. Dr. Liebscher, Prof. Dr. Moser, Prof. Dr. Scherer

Further Information For advice and coordination of the courses, please contact the module supervisor. Please see the course list below.

Advanced Electron Microscopy

	Credits	Workload	Semester	Cycle	Duration
	8 CP	120 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture “Advanced Electron Microscopy” b) Exercise “Advanced Electron Microscopy”	a) 33 h b) 11 h	a) 57 h b) 19 h	a) Unlimited b) Unlimited

Requirements for Participation
Formal None
Content Basic knowledge of optics, solid state physics and quantum mechanics
Preparation None

Learning Outcomes
After successful completion of the module

- students know the basic working principles of electron microscopes and crystallography with a focus on transmission electron microscopy
- students understand the basics of electron wave propagation in solids
- students gain knowledge in aberration-corrected electron optics
- students learn to differentiate between high resolution transmission electron microscopy and scanning transmission electron microscopy
- students understand how to interpret and simulate atomic resolution images
- students are familiar with differential phase contrast imaging and electronic ptychography
- students obtain knowledge in advanced electron tomography and spectroscopy

Contents
The course starts with explaining the working principles of electron microscopes with a focus on transmission electron microscopy. The basic principles of crystal lattices and electron diffraction will be explained. Students will learn to describe the electron wave propagation and related approximations in crystalline materials. The concepts of aberration-correction electron optics will be discussed before explaining the mechanism of atomic resolution imaging by high resolution transmission electron microscopy and scanning transmission electron microscopy. With this knowledge, students will learn how to interpret atomic resolution images and use computer simulations to gain quantitative insights in the atomic structure of solid state materials. The students will gain first insights into advanced interferometric imaging methods such as electron ptychography to image the atomic structure of weak scattering objects (light elements). Electron tomography will be introduced, and students will learn how to obtain three-dimensional information from samples down to the atomic level. The students will obtain knowledge in atomic level X-ray and electron energy loss spectroscopy and understand the principal concept of vibrational spectroscopy in the electron microscope. In the exercises, the use of computer-based simulation and analysis tools will be introduced. Students will learn how to simulate and analyse complex multidimensional datasets.

Format of Teaching Lecture, Exercise

Format of Examination The students give a talk of 45 min, plus discussion within the lecture group.

Requirements for the Attribution of Credit Points Active participation (>75%) and successful presentation with valid discussion.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Liebscher

Advanced Physics of 2D Materials

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Summer (Not in SoSe26)	1 Semester
Courses a) Lecture "Advanced Physics of 2D Materials"			**Contact Hours** a) 22 h	**Self-Study** 38 h	**Group Size** a) Unlimited

Requirements for Participation
Formal None
Content Basic knowledge of solid state physics is highly appreciated
Preparation Participation in the module "Introduction to Solid State Physics" is useful

Learning Outcomes
After successful completion of the module, students have a basic understanding of

- two-dimensional materials
- Moiré pattern
- Magic angle bi-layer graphene
- Superconductivity in graphene
- Magnetism in two-dimensional materials
- Experimental techniques such as synthesis of 2D materials, exfoliation techniques
- Potential applications of 2D materials

Contents
In recent years two-dimensional van der Waals materials are at the forefront of research in condensed matter physics and material science. On the one hand, the magic angle bi-layer graphene has set a new trend in unconventional superconductivity. On the other hand, the presence of long-range magnetic order in two-dimensional van der Waals materials have completely opened a new avenue for the investigation of magnetism in true 2D-systems. This lecture will cover the most recent advancements in the field of 2D-materials starting from the magic angle bi-layer graphene (MABLG), Moiré pattern, emerging magnetic van der Waals materials and their potential for applications. The experimental techniques used to synthesize these 2D-materials together with the exfoliation techniques.

Format of Teaching Lecture, Seminar, Exercise

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min or oral examination of 45 min)

Requirements for the Attribution of Credit Points Depending on the specified form of examination: The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Böhmer

Further information

Advanced Solid State Theory

	Credits	Workload	Semester	Cycle	Duration
	6 CP	180 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Advanced Solid State Theory b) Exercises for Advanced Solid State Theory	a) 44 h b) 22 h	114 h	a) Unlimited b) 25

Requirements for Participation
Formal None
Content Basic knowledge of solid state theory, statistical mechanics and quantum mechanics is desirable
Preparation None

Learning Outcomes
After successful completion of the module

- students have a basic understanding of the modern methods of the theoretical solid state physics including quantum field theory methods and many-body theory
- Students can derive an effective Hamiltonian of the given solid state systems using second quantization and to compute elementary excitations and thermodynamic observables
- students know the basic concepts of functional integral description of the thermodynamic phase transitions in solid state systems
- students are familiar with Feynman diagrams at zero and finite temperatures and can use this formalism for various model systems
- students can employ simple numerical algorithms to obtain the thermodynamic properties of the quantum mechanical systems using Monte-Carlo or similar techniques

Contents

- Green's Functions (Interaction representation, Green's Functions: Many particle Green's functions); Zero Temperature Feynman Diagrams, Feynman rules in momentum space, the self-energy, response functions, the RPA (Large-N) electron gas;
- Finite Temperature Many Body Physics, Imaginary Time Green Functions, Generating Function and Wick's theorem, Examples of the application of the Matsubara Technique,
- Fluctuation Dissipation Theorem and Linear Response Theory, Electron Transport Theory, The Kubo Formula,
- Phase Transitions and broken symmetry, Ginzburg Landau theory, Thermal Fluctuations and criticality,
- Coherent states and path integrals, Effective action and Hubbard Stratonovich transformation,
- Superconductivity and BCS theory, Local Moments and the Kondo effect.

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of the examination. (written exam of 90 min, oral exam of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the Attribution of Credit Points Depending on the defined form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also mandatory. The form of examination will be determined at the beginning of the course.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Advanced Techniques in Transmission Electron Microscopy (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter & Summer not in SoSe 26	1 semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar "Advanced Techniques in Transmission Electron Microscopy"	a) 22 h	38 h	a) Unlimited

Requirements for Participation

Formal None

Content Basic knowledge in electron microscopy, ideally acquired by attending the lectures "Physical Principles of Electron Microscopy" and/or "Advanced Electron Microscopy", but not required.

Preparation None

Learning Outcomes

The seminar will cover recent developments in electron microscopy, discussing new technique developments and their applications. The students will learn how to understand and summarize research papers, critically reflect on their content and present the work. They will engage in active discussions of the presented content with experts, which requires participation in most of the seminars.

Contents

The seminar will be platform to discuss recent developments in electron microscopy. Either techniques that are being developed at the Institute of Solid State Physics are discussed, or selected topics (e.g. momentum resolved, high energy resolution or ultrafast microscopy) are being prepared by the students. The students will be assisted by expert advisors on how to perform literature research, to prepare the content for a presentation and how to present content to an audience. The active engagement in the seminar series by following other presentations and discussions will provide the students with a broad overview in current technique development in electron microscopy and equip them with presentation and discussion skills.

Format of Teaching Seminar

Format of Examination The students give a talk of 30 min plus discussion within the seminar group.

Requirements for the Attribution of Credit Points Active participation (>75%) and successful presentation with valid discussion.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Requirements for Participation
Formal none
Content Will be provided
Preparation Participation in module "Special Problems in Applied Solid State Physics" is recommended. Preparation of the content will be checked in advance.

Learning Outcomes
After successful completion of the module
- students have a basic understanding of how semiconductor devices are made from semi-conductor chips. And how these functions are tested.
- Students are aware of the capabilities of photolithography, device testing setups, focused ion implantation.
- students know the basic concepts of semiconductor devices
- are familiar with photo lithography

Contents
In the practical course, students independently produce a simple field-effect transistor. Basic techniques of semiconductor processing, such as photolithography and wet chemical etching, are learned. Furthermore, students will use focused ion implantation to modify the electrical proper- ties of semiconductor heterostructures. The electrical characterization of the fabricated devices is another focus of the lab. Here, modern, electrical measurement techniques are used for device characterization. Each practical day is introduced with a lecture of about 45 minutes, in which the basics for the day's work are explained.

Format of Teaching Lab course and lecture

Format of Examination Oral exam about content and plan how to measure the device (midterm during the week). Presentation after the practical.

Requirements for the Attribution of Credit Points Successful oral exam and presentation.

Use of the Module Advanced lab course block in Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

a) Lecture Computer Simulations in Statistical Physics b) Exercises for Computer Simulations in Statistical Physics	a) 44 h b) 22 h	114 h	a) Unlimited b) 30

Requirements for Participation

Formal None

Content None (Recommended: Basic concepts of classical and statistical mechanics)

Preparation None

Learning outcomes

After successfully passing the exam:

- the students will understand the algorithms used to perform state-of-the-art molecular dynamics and Monte Carlo simulations in Statistical Physics
- they will be able to make computer programs to perform and analyse those simulations
- they will have the knowledge to use and understand available program packages from the literature to perform the simulations

Contents

- Short introduction to basic concepts of thermodynamics, statistical mechanics and intro- duction to error analysis
- Classical molecular dynamics (MD): integration algorithms, accuracy, thermostats and barostats, Ewald summation
- Monte Carlo and kinetic Monte Carlo: importance sampling, canonical ensemble, master equation
- Grand-canonical simulations and free energy methods
- Quantum mechanical approaches and density functional theory
- Hands-on examples: MD simulations of the Lennard-Jones fluid, MD simulations of the biomolecules, Ising model

Format of Teaching Lecture, Exercises

Format of Examination Oral exam 30 min

Requirements for the Attribution of Credit Points Successful oral exam

Use of the Module Courses in Focus Area

Preparation Read articles and participation in module "Special Problems in Applied Solid State Physics" is recommended."

Learning Outcomes
After successful completion of the module

- students have a basic understanding of how to read and understand a scientific article, simplify its content and present it in a compact and concise way.
- Students are aware of the capabilities to access journal articles behind a paywall from the university bibliographic system
- students know the basic concepts of scientific presentation of content, ask basic and scientific questions
- are familiar with literature research methods

Contents
In this journal club we gather weekly to discuss recent relevant research published in scientific journals. One participant of the club presents a summary of the chosen paper that the whole group has read. Then, the content is discussed. Attendees ask clarifying questions, discuss different aspects of the experimental design, critique the methods, judge the writing style, and bring a healthy amount of scepticism (or praise) to the results.

Format of Teaching Seminar

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Quantum Materials	a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation Participation in the module "Introduction to Solid State Physics" is recommended

Learning Outcomes
After successful completion of the module

- students have a basic understanding of the solid-state physics of quantum materials
- students can independently familiarize themselves with an advanced topic in the field of solid state physics of quantum materials
- students have gained experience in literature research
- students are familiar with creating and giving scientific presentations

Contents
Quantum materials are materials whose properties are decisively determined by quantum mechanics. As a part of condensed matter physics, this seminar will provide insight into some of the most famous quantum materials such as heavy fermion systems, high-temperature superconductors and topological materials. In addition to these important concepts of condensed matter physics, we will also get to know a range of experimental techniques that were used to find out about them. Thus, we will get insight into the process of understanding a new material in condensed matter physics and the critical analysis of experimental results and their interpretations.

Format of Teaching Seminar

Format of Examination Presentation, evaluated according to the criteria below

Requirements for the Attribution of Credit Points The criteria for evaluating the seminar presentation are the quality of the thematic introduction, the quality of the presentation slides, the quality of the presentation and the answers to questions about the presentation.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Requirements for Participation
Formal None
Content None
Preparation Basic knowledge of quantum mechanics / solid state physics and thermodynamics / statistical physics is recommended

Learning Outcomes
After successful completion of the module
- students possess a conceptional understanding of complex phase transitions in solid state materials (e.g. superconducting and ferroic phases)
- students are familiar with state of the art analytical and numerical scale-bridging modelling methods in this field
- students can judge, compare and utilize these concepts and methods
- students can identify the underlying physical properties

Contents
- Introduction to complex phase transitions in solid state materials (e.g. magnetic, ferro- electric and superconducting phases)
- Classification of phase transitions and critical phenomena
- Models and simulation methods (e.g. spin models, Landau theory)

Format of Teaching Lecture, Exercises

Format of Examination Presentation of project work and short oral examination related to the project

Requirements for the Attribution of Credit Points Taking part in the exercises, successful oral presentation of the project

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Böhmer, Dr. Grünebohm

Further information Lecture notes will be provided.

a) Lecture Physical Principles of Electron Microscopy	a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content Basic knowledge of optics, solid state physics and quantum mechanics
Preparation None

Learning Outcomes
After successful completion of the module

- students understand the basic elements of electron microscopes
- gain knowledge in electron optics
- are familiar with electron-specimen interactions
- students understand electron scattering and diffraction theory
- can connect the theory of image formation with image contrast interpretation
- obtain first insights into spectroscopic techniques

Contents
Students will learn to describe the basic elements of electron microscopes (electron guns, electro-magnetic lenses, electron detectors) and are able to understand the particle and wave nature of electron optics. The course will explain the fundamental mechanisms of electron specimen interactions with a focus on elastic and inelastic scattering. Details of image formation mechanisms related to scattering and phase contrast will be described to be able to interpret image contrast formation. The basic theory of electron scattering and diffraction will be explained and will be demonstrated by experimental examples. The course will provide first insights into spectroscopic techniques and how they can be used to analyse the composition and electronic structure of solid state materials.

Format of Teaching Lecture

Format of Examination The students give a talk of 45 min. plus discussion within the lecture group

Requirements for the Attribution of Credit Points Active participation (>75%) and successful presentation with valid discussion.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Liebscher

Further information

Physical Principles of Quantum Information

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Summer not in SoSe 26	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Physical Principles of Quantum Information b) Exercises for Physical Principles of Quantum Information	a) 22 h b) 22 h	76 h	a) Unlimited b) Unlimited

Requirements for Participation
Formal None
Content Knowledge of linear algebra, quantum mechanics
Preparation None

Learning Outcomes
Understanding of the physical principles of quantum information and quantum engineering with quantum superconducting circuits

Contents
In the first part of the course the basic principles of quantum information, i.e., quantum logic and algorithms, quantum computing, adiabatic quantum computing, quantum games, quantum ma- chine learning, quantum simulations, etc., will be addressed. The second part of the course will be devoted to a particular realization of quantum information devices, i.e., super-conducting qubits circuits.

Recommended literature:
- M. A. Nielsen, I. Chuang, "Quantum computation and quantum information"
- D. Heiss, "Fundamentals of quantum information: quantum computation, communication, decoherence and all that"
- M. Kjaergaard et al. "Superconducting qubits: Current state of play"

Format of Teaching Lecture, Exercises

Format of Examination Oral exam 30 min

Requirements for the Attribution of Credit Points Successful oral exam

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Dr. Fistul

Further information Lectures and exercises will be in English

Scientific Methods of Semiconductor Physics

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	from 1. Sem.	Winter & Summer not in SoSe 26	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Scientific Methods of Semiconductor Physics b) Exercises for Scientific Methods of Semiconductor Physics	a) 22 h b) 11 h	57 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successful completion of the module

- students have a basic understanding of preparation, work principles and analytics of semiconductor devices
- Students are aware of the capabilities of semiconductors in transport and optics
- students know the basic concepts of thermodynamics concerning evaporation rates, electric charge carrier densities and excitations in solids
- are familiar with electron and hole dynamics in semiconductors
- students can recognize connections between the materials and bandgaps, doping, mobility and electrical conductivity and apply this knowledge to all semiconductors

Contents
Material composition of semiconductors from the periodic table, bandgaps, pn-junction, Shockley-equation, bipolar transistor, historical point-contact Schottky-transistor, field-effect transistor, cur- rent-voltage (IV) measurements, temperature dependence of the electric carrier density, simple basic circuits with diodes and transistors, negative and positive feedback, operational amplifiers, linearization of non-linear active devices, noise, oscilloscope, spectrum analyser, lock-in amplifier, typical and popular semiconductor devices with hints for their applications in laboratory life, checking of individual or connected devices, typical failures in electronics, electrolytic capacitors and their problems, sustainability aspects and planned obsolescence including strategies how to react, repair strategies of electronic equipment

Format of Teaching Lecture, Exercises

Format of Examination In the last part of the semester, each student performs a talk of 45 min. about a self-defined subject in the vicinity of the lecture’s contents in front of the whole auditorium and the professor. If this is not possible for administrative reasons (e.g. not enough dates available), an individual oral examination of 45 min. will be performed

Requirements for the Attribution of Credit Points Successful talk / examination

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor

Selected Topics of Applied Solid-State Physics (Seminar)

	Credits	Workload	Semester	Cycle not in SoSe 26	Duration
	2 CP	60 h	from 1. Sem.	Winter & Summer	1 Semester
Courses			**Contact Hours**	**Self-Study**	**Group Size**
a) Seminar Selected Topics of Applied Solid State Physics			a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation None or "Participation in solid state physics module is recommended."

Learning Outcomes
After successful completion of the module

- students have a basic understanding of applied solid state physics
- Students are aware of the capabilities of semiconductors in transport and optics
- students know the basic concepts of molecular beam epitaxy and focused ion beam technology
- are familiar with experimental techniques of actual semiconductor research
- students can recognize connections between semiconductor materials and their applications

Contents
Talks and discussions on actual topics of applied solid state research. In particular, molecular beam epitaxy and focused ion beam technology including the preparation of semiconductor devices and technical aspects of the applied instruments/machines. An important issue is the creation of ultra- high vacuum for most of the preparative techniques. Frequently discussed subjects are quantum devices like single photon sources, quantum dots and low-dimensional electrical carrier systems in general.

Format of Teaching Lecture, talks, discussions

Format of Examination The student performs a talk of 45 min. plus discussion within the research group

Requirements for the Attribution of Credit Points Successful talk with valid discussion

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Dr. Ludwig,

Semiconductor Band Structures (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	1 CP	30 h	from 1. Sem.	Winter & Summer not in SoSe 26	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Semiconductor Band Structures	a) 11 h	19 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation Participation in module "Special Problems in Applied Solid State Physics" is recommended.

Learning Outcomes
After successful completion of the module

- students have a basic understanding of semiconductor band structure calculations
- Students are aware of the capabilities of software packages to perform complex device simulations
- students know the basic concepts of heterostructure devices
- are familiar with creating device concepts based on band structure and functionalities

Contents
The ability to create semiconductor heterostructures by combining different constituents from the periodic table of elements in perfect crystalline arrangements is a huge technological leap. It enabled the creation of highly efficient and miniaturized optoelectronic devices like laser light sources and ultrafast electronic components. Key to this is the control of the arrangement of the crystal matrix elements and dopants resulting in the band structure, the spatial arrangement of the electrostatic potential and (quantized) energy states of carriers. In the seminar we will calculate the quantized states and the band structure of different devices like quantum wells, high electron mobility transistor and diode structures. The structures developed in practical exercises will be in close relation to structures used for quantum experiments with e.g. qubit, single photon source, and single electron source Leviton devices.

Format of Teaching Seminar

Format of Examination Active participation and presentation of an own simulation project

Requirements for the Attribution of Credit Points Active participation and presentation

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Dr. Ludwig

Semiconductor Physics I

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Semiconductor Physics I b) Exercises for Semiconductor Physics I	a) 33 h b) 11 h	76 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successful completion of the module

- students have a basic understanding of crystals, doping, electronic transport, band structures and optics in semiconductors
- Students are aware of the capabilities of different models applied to describe semiconductor physics
- students know the basic concepts of selected semiconductor devices
- students are familiar with semiconductors

Contents
Crystals, band structures, doping, electronic transport and optics in semiconductors are covered to achieve a basic understanding in these concepts. Models to describe and methods to produce semiconductors are introduced. The physics and operation principles of selected semiconductor devices are presented.

Format of Teaching Lecture, Exercise

Format of Examination Oral examination at the end of the lecture

Requirements for the Attribution of Credit Points Active participation in the training class and pass the oral exam

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Dr. Ludwig

Further information

Solid State Physics Theory (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar Solid State Physics Theory	a) 22 h	38 h	a) 25

Requirements for Participation
Formal None
Content Basic knowledge of solid state theory, statistical mechanics and quantum mechanics is desirable
Preparation None

Learning Outcomes
After successful completion of the module

- students have developed a basic understanding of the modern topics of the solid state theory
- Students can work independently with the modern literature on theoretical and experimental solid state physics and make scientific presentations on a given topic
- students know the basic concepts of solid state theory and can use them to understand and to comprehend new scientific articles

Contents
Brief description of the subject content:

- topological band theory and its application to the novel quantum materials
- basics of the quantum information and qubits realization
- concepts of Phase Transitions and broken symmetry
- Coherent states and path integrals,
- Superconductivity and BCS theory

Format of Teaching Seminar

Format of Examination The seminar is examined via a presentation by the student on the selected topic related to modern research.

Requirements for the Attribution of Credit Points Depending on the defined form of examination: Passing the written/oral examination or obtaining at least 50 % of the possible points in the weekly exercises. In this case, active participation in the exercise is also mandatory. The form of examination will be determined at the beginning of the course. In addition, the F practical course must be completed successfully. Both grades go into the module grade with the CP weighted.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Eremin

Further information

Spintronics and Ultrafast Spectroscopy (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	from 1. Sem.	Winter & Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Spintronics and Ultrafast Spectroscopy	a) 22 h	38 h	a) Unlimited

Requirements for Participation
Formal None
Content None
Preparation Physik IIIa/b

Learning Outcomes
After successful completion of the module

- students have a basic understanding of basic concepts of time-resolved spectroscopy, non-linear optics, higher order coherence in stochastic measurement outcomes, and spintronic devices.

Contents
Time-resolved pump-probe spectroscopy with 100 fs – temporal resolution. Non-linear optics. Spin noise spectroscopy. Second order frequency resolved spectra. Higher order polyspectra and their measurement. Quantum Polyspectra. Optical spin injection. Spin-transport.

Format of Teaching Seminar talks by students and instructors

Format of Examination The student prepares and delivers a talk at the seminar (35-45 Minutes) and is prepared for a subsequent discussion.

Requirements for the Attribution of Credit Points Successful examination. Attendance of the seminar and oral contributions to discussions.

Use of the Module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module Supervisor and Instructor Prof. Dr. Hägele

Further information

Surface Science

	Credits	Workload	Semester	Turnus	Duration
	6 CP	180 h	from 1. Sem.	Summer	1 semester

Courses	contact time	self-study time	Group size
b) Lecture "Surface Science" c) Exercises "Surface Science"	c) 44 h d) 22 h	114 h	e) Unlimited f) 30

Participation requirements
Formal: none
Content: Basic knowledge of solid-state physics, statistical mechanics and quantum mechanics
Preparation: None

Learning outcomes
After successful completion of the module, students will be able to:
- **Explain the fundamental physical and chemical properties of solid surfaces**, including surface structure, energetics, electronic states, and adsorption phenomena.
- **Describe and compare key synthesis and preparation techniques** for well-defined surfaces and low-dimensional systems, including thin-film growth and surface functionalization methods.
- **Demonstrate foundational knowledge of ultrahigh vacuum (UHV) technology**, including vacuum generation, pressure measurement, residual gas analysis, and contamination control.
- **Identify and evaluate major surface-sensitive characterization techniques**, such as photoelectron spectroscopy, electron diffraction, scanning probe microscopy, and related methods, with respect to their information depth, resolution, and limitations.
- **Assess how established surface science methodologies enable the design, engineering, and characterization of modern quantum materials**, including two-dimensional systems and topological materials.
- **Recognize the interplay between structure, electronic properties, and functionality at surfaces**, and apply core surface-science concepts to analyze experimental data and interpret surface-related phenomena.
- **Critically interpret experimental results from surface-sensitive measurements** and relate them to underlying microscopic models.

Content
1. Properties of surfaces (atomic and electronic structure of surfaces)
2. Processes at surfaces (adsorption, desorption, diffusion, film growth and epitaxy)
3. Preparation of surfaces (physical and chemical methods)
4. Diffraction methods (Electron, X-ray and Helium diffraction)
5. Electron spectroscopies (Photoelectron, Auger and X-ray absorption spectroscopies)
6. Scanning probe microscopies (Scanning tunnelling and atomic force microscopies)

Teaching forms Lecture, Exercises

Form of examination At the beginning of the course, the lecturer determines the form and duration of the examination. (written exam or oral exam or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the award of credit points
Depending on the specified form of examination:
Passing the exam or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation (> 75 %) is mandatory.

Use of the module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module coordinator/full-time lecturer Prof. Dr. Simon Moser

Surface Science Seminar

	Credits	Workload	Semester	Turnus	Duration
	2 CP	60 h	1./2. Sem.	Summer	1 semester

Courses	contact time	self-study time	Group size
d) Surface Science Seminar	e) 22 h	38 h	g) Unlimited

Participation requirements
Formal: none
Content: none
Preparation: none

Learning outcomes

After successful completion of the module
- students can work on topics from surface science independently
- students can receive and understand specialist articles by scientists from the international research landscape
- students can lead a technical discussion on topics of surface science

Content
The seminar deals with sub-areas of research in the field of surface science and related fields. Methods and instrumentation relevant to this field can also be covered.

Teaching forms Seminar

Form of examination Presentation

Requirements for the award of credit points
Active participation and presentation

Use of the module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Theory of Quantum Fields and Quantum Materials (Seminar)

	Credits	Workload	Semester	Cycle	Duration
	2 CP	60 h	1./2. Sem.	Winter/Summer	1 semester
Courses a) Seminar "Theory of Quantum Fields and Quantum Materials"			**contact time** a) 22 h	**self-study time** 38 h	**Group size** a) 15

Participation requirements
Formal: None
Content: Advanced topics of theoretical solid state and condensed matter physics, and current research projects
Preparation: Introduction to Theoretical Solid State Physics I, Thermodynamics and Statistical Physics,
Advanced Solid State Theory and Quantum Field Theory are advantageous

Learning outcomes

After successful completion of the module
- students have an advanced understanding of theoretical solid state physics
- are aware of current directions of research in solid state and condensed matter physics
- students know the basic concepts for the description of quantum phase transitions and strongly-correlated states in solids and other forms of condensed matter
- are familiar with application of quantum-many-body approaches to solids
- students can recognise connections between quantum field theory and its application to solid state physics

Content
Talks and discussions on current research topics in the field of theoretical solid state physics. In particular, emergent phenomena, quantum phase transitions, topological properties, and correlated behavior of quantum matter and quantum materials. Development and application of modern quantum field theoretical methods to understand and predict novel effects in solids and other forms of condensed matter.

Teaching forms Seminar talks, discussions

Form of examination
The student performs a talk of 45 min. plus questions on the presentation followed by a discussion with the research/seminar group.

Requirements for the award of credit points
Successful talk with in-depth discussion.

Use of the module Courses in Focus Area

Importance of the Mark for the final grade Graded, but does not contribute to the weighted average final grade

Module coordinator/full-time lecturer Prof. Dr. Scherer

Modules 4 Elective Modules from the Catalogue for Minor Subjects

Modules amounting to 5-18 CP can be brought in from the range of other faculties and their subjects. However, should you plan to **write the master's thesis in the minor subject**, 15 CP must be taken in the minor subject in which the thesis is written.

Please note: All modules and courses must be assigned to the degree program with a grade. For ungraded courses, a grade of 4.0 must be entered when assigning them to the degree program.

Offers from the Faculty of Chemistry and Biochemistry (Chemie und Biochemie)

Minor Subject:	**Modules**	**Semester**	**Language**
Inorganic Chemistry (Anorganische Chemie)	Methods of Structure Analysis II (Methoden der Strukturanalyse II)	Summer	English
	Inorganic Chemistry II (Anorganische Chemie II)	Summer	German
	Block Courses Inorganic Chemistry (Anorganisch-Chemisches Grundpraktikum)	Summer	German
Biochemistry (Biochemie)	Biochemical Practical Course for Chemists (Biochemisches Praktikum für Chemiker/-innen)	Winter	German
	Introduction to Biochemistry (Einführung in die Biochemie)	Summer	German

Modules 5 (Elective Modules from the Area for Key Competences)

Modul 5a Computational Physics I

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Winter	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Lecture Computational Physics I b) Exercises for Computational Physics I	a) 22 h b) 22 h	76 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successfully completing the module, the students

- have a basic understanding of fundamental numerical methods and procedures for dealing with physical problems
- are aware of the possibilities of concrete implementation and verification
- are familiar with the application to physical model problems

Contents

- Numerical differentiation and integration
- Ordinary and partial differential equations
- Linear systems of equations
- FFT
- Monte Carlo methods
- Practical exercises with Matlab, Python or Julia

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course.

Use of the Module Key Competences

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Dr. Dreher

Modul 5b Computational Physics II

	Credits	Workload	Semester	Cycle	Duration
	4 CP	120 h	from 1. Sem.	Summer	1 Semester

Courses	Contact Hours	Self-Study	Group size
a) Lecture Computational Physics II b) Exercises for Computational Physics II	a) 22 h b) 22 h	76 h	a) Unlimited b) 30

Requirements for Participation
Formal None
Content Knowledge from Computational Physics I will be appreciated
Preparation None

Learning Outcomes
After successfully completing the module, the students

- have a basic understanding of advanced numerical methods and applications in physics
- are aware of the possibilities and limitations of the use of numerical methods
- re familiar with the basic concepts of multiscale methods, stochastic differential equations, Monte Carlo methods
- are familiar with the possibilities of parallelisation

Contents

- Multiscale methods: FFT, Multigrid, Wavelets, Barnes-Hut, Fast Multipole Method, Particle in Cell methods (Boris-Push).
- Stochastic differential equations, Monte Carlo methods, Metropolis algorithm, Ising model
- Parallelisation: MPI, CUDA
- Finite Volume, Discontinues Galerkin

Format of Teaching Lecture, Exercises

Format of Examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the Attribution of Credit Points Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course.

Use of the Module Key Competences

Importance of the Mark for the final grade: Weighted according to Credit Points

Module Supervisor and Instructor Prof. Dr. Innocenti

Further Information

Modul 5c Introduction to Programming with Julia for Physicists

	Credits	Workload	Semester	Term	Duration
	3 CP	90 h	from 1. Sem.	Summer	1 semester
Courses e) Lectures on Programming f) Exercises on Programming			**contact time** f) 22 h g) 11 h	**self-study time** 57 h	**Group size** h) unlimited i) 30

Participation requirements
Formal: none
Content: none
Preparation: none

Learning outcomes
After successful completion of the module, students
- understand what code is and how a program is executed;
- can read, write, and modify simple Julia programs;
- know the core programming concepts: variables, types, expressions, conditionals, loops, functions, and basic data structures;
- can use arrays and simple file input/output for small computational tasks;
- can debug simple programs and interpret common error messages;
- can use assertions and simple tests to check whether code and AI-assisted output behave as expected;
- can use notebooks or scripts to solve introductory quantitative problems;
- understand how programming supports scientific reasoning, data handling, and reproducible work.
- understand basic principles and practical aspects of version-control systems

Content
This course provides a compact, hands-on introduction to programming using the Julia language. It is designed for physics students who want to understand how code works and how computational problems are formulated and solved. The course focuses on programming fundamentals rather than advanced software engineering or specialized research topics. Topics include expressions, variables, numerical and boolean types, strings, collections, control flow, functions, arrays, basic plotting, simple file handling, assertions, and small test setups. The course also briefly addresses how to validate AI-assisted code and language-model output with checks instead of accepting it blindly. Interactive notebooks and practical exercises are used throughout, with simple examples from physics to support quantitative thinking.

Format of Teaching lecture, exercise

Format of examination: final grade will be a 30/70 weighting of average homework assignment score and final exam score.

Requirements for the award of credit points
Active participation in the exercises and successful completion of the final exam, participation at least 50% of exercises gives an admission to the exam

Use of the module Key Competences

Importance of the grade for the final grade Weighted according to Credit Points

Module coordinator/full-time lecturer Prof. Dr. Mikhasenko

Modul 5d Presentation Skills

	Credits 3 CP	Workload 90 h	**Semester** 1.Sem.	**Turnus** summer	**Duration** 1 semester
Courses g) Seminar "Presentation Skills" h) Exercise "Presentation Skills"			**contact time** h) 22 h b) 11h	**self-study time** 38 h 19h	**Group size** j) 20 b) 20

Participation requirements
Formal: none
Content: none
Preparation: none

Learning outcomes
After successful completion of the module
- students have a basic understanding of how to structure a presentation
- students learn how to engage their audience during a presentation
- students know the basic concepts of body language
- students know how to design their slides for a presentation

Content
After an introduction on how to give a good presentation, students will practice using the tools that were introduced. This includes preparing and practicing short talks outside of class and presenting them in class followed by feedback from the other students and the lecturer. A tutorial is offered where students are actively supported in preparing their presentations for the class.

Teaching forms lecture, seminar, practical exercise

Format of examination Active participation in class is required, which includes giving feedback to the other students. The grade will be an average of the grades for short presentations given in class (80%) and active participation in the feedback rounds (20%).

Requirements for the award of credit points
Presentations given in class and participation in discussion and feedback round will be graded. Active participation (> 75 %) in the seminar is mandatory.

Use of the module key competences

Importance of the grade for the final grade Weighted according to Credit Points

Module coordinator/full-time lecturer Prof. Anna Franckowiak

Other information

Modul 5e Python for Physicists and Astronomers

	Credits	Workload	Semester	Cycle	Duration
	3 CP	90 h	3.	WiSe	1 Semester
Courses a) Lectures Python for Physicists b) Exercises Python for Physicists			**Contact Hours** a) 26 h b) 12 h	**Self-Study** 52 h	**Group Size** a) 30 b) 30

Requirements for Participation

Formal: None

Content: None

Preparation: None

Learning outcomes

During this course, the students will:

- acquire basic knowledge of the Python language;
- understand the basic components of object-oriented programming, such as classes, scope, functions and basic data structures;
- gain hands-on experience with essential scientific Python tools like numpy, pandas, scipy, matplotlib and astropy;
- become acquainted with common tasks in Physics like optimization, data fitting, simple Monte Carlo sampling, and data visualization;
- learn to tackle physics and statistics problems with a computational approach.

Contents

1. Intro - types, containers 2. Iterating 3. Functions 4. Classes 5. Operating system and files 6. numpy - working with arrays in python 7. Plotting with matplotlib 8. Modules and scripts 9. scipy I - fitting plots and histograms, minimization 10. scipy II - integration, interpolation statistics 11. Handling large datasets with pandas 12. scikit-learn - machine learning with python

Format of Teaching Lecture, Tutorial, Homework

Format of Examination Written exam at the end of term. 70% of homework must be completed to register for the exam.

Requirements for the Attribution of Credit Points

The grade will be calculated from the scores on the homework and the score on the final exam, with the following weighting: 70% exam, 30% homework score.

Use of the Module: Key Competence

Importance of the grade for the final grade Weighted according to Credit Points

Module Supervisor and Instructor: Dr. Elisa Pueschel

Further Information The lecture and tutorials will be held in English.

Modul 5f Scientific English

	Credits	Workload	Semester	Cycle	Duration
	5 CP	120 h	from 1. Sem.	Winter & Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Seminar English for Students of Physics and Astronomy and Other Subjects (from Level B1/B2) b) Online-Exercises	a) 22 h	98 h	a) 30 b) Unlimited

Requirements for Participation

Formal Proof of language aptitude through an entrance test (cf. www.zfa.rub.de)

Content None

Preparation None

Learning Outcomes

After successfully completing the module, the students

- can present themselves, their studies and their interests in a concise and comprehensible way
- can extract important information from specialised texts by using specific reading techniques. They can use such extracted quotations and evidence to defend their own point of view
- Students can work out the function and form of different types of texts and apply this knowledge competently in self-produced texts
- can understand both essential and detailed information from listening and reading texts and communicate this clearly, precisely, and concisely to others, both orally and in writing
- can make a topic of interest accessible to non-experts (laypersons) in a lecture and to answer questions on it
- re able to express and ask for personal points of view and opinions, formulate arguments and counterarguments and point out advantages and disadvantages in a discussion on specialised topics and topics of their own interest

Contents

The course is divided into a face-to-face phase (2 hours) and an online phase (freely divisible practice times). The focus of the face-to-face course is on the communicative use of language in reception, production, interaction and mediation, both in written and spoken form. Various reading strategies are taught and applied, and students work with authentic audio and visual texts on Moodle. Furthermore, the specific vocabulary in the field of physics and astronomy is trained. Blended Learning: The course is accompanied by a specific e-learning offer, which is an integral part of the course. It therefore consists of two parts:

1. face-to-face course.
2. moodle course in blended learning format, in which, with the help of the materials provided 4-5 different types of texts are written and revised based on individual feedback

Format of Teaching Seminar, practical exercises

Format of Examination Written Exam

Requirements for the Attribution of Credit Points Active participation in the seminars (>75%), passing the examination

Use of the Module Key Competences

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Davis

Further Information This module is offered by the Centre of Education in Foreign Languages (www.zfa.rub.de).

Modul 5g Symbolic Calculations					
	Credits 4 CP	**Workload** 120 h	**Semester** From 1. Sem.	**Turnus** Summer	**Duration** 1 semester
Courses i) Lecture "Symbolic Calculations" j) Exercises to "Symbolic Calculations"			**contact time** i) 22 h j) 22 h	**self-study time** 76 h	**Group size** k) Unlimited l) 20

Participation requirements
Formal: none
Content: none
Preparation: none

Learning outcomes
After successful completion of the module, the students
- understand how computer algebra systems represent and evaluate symbolic expressions
- can perform exact algebraic manipulation and solve equations symbolically
- learn design efficient and reproducible symbolic workflows
- are aware of limitations and potential sources of error in symbolic computation
- learn to combine rules, solvers, and transforms to solve symbolic problems from science or engineering and critically evaluate the outcome.

Content
Lectures and practical exercises with Mathematica in SÜDPOL computer class.
- Fundamentals of symbolic computations and functional programming
- Expression manipulation, assumptions, and simplification
- Design of transformation rules and patterns
- Symbolic differentiation, integration, limits, series, transforms
- Symbolic linear algebra, matrix operations, algebraic equation systems
- Visualization, presentation and verification of symbolic computation results

Teaching forms Lecture, Exercises

Form of examination At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.

Requirements for the award of credit points
Depending on the specified form of examination:
Passing the written examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course.

Use of the module Key Competences

Importance of the grade for the final grade Weighted according to credit points

Module coordinator/full-time lecturer Dr. Filin

Other information

List of Additional Key Competences

In justified exceptional cases, modules that are not in this module handbook may also be recognised. For this purpose, a justified request must be submitted to the study advisor (Dr. Ivonne Möller).

All modules and courses must be assigned to the degree program with a grade. For ungraded courses, a grade of 4.0 must be entered when assigning them to the degree program.

Note on Programming Languages:
All modules that deepen a programming language (C, C++, Python, Java, PHP or Modula) can be chosen from the RUB's offer (e.g. the module "Computer Science I (from winter semester 21/22: "Programming for ITS") on the programming language TScript). However, modules that only represent a basic introduction to the understanding of programming techniques cannot be credited in the M.Sc. in Physics.

Modul 5z List of further Modules

From the catalogue of the Faculty of Computer Science (Informatik):

Module	Credits	Semester	Frequency / Further Information	Duration	Language
Information Theory (VVZ-Nr.: 211007)	5 CP	Summer	https://qi.rub.de/it_ss23 <https://qi.ruhr-uni-bochum.de/it_ss23>)	1 Semester	English

From the catalogue of RUBION:

Module	Workload/Credits	Semester	Frequency	Duration	Language
Basic Course in Radiation Protection according S4.1 (Grundkurs im Strahlenschutz nach der Fachgruppe S4.1)	150 h/5 CP	Winter/ Summer	s. RUBION	Block Course	German

From the catalogue of the Academic Writing Centre (Schreibzentrum):

Module	Credits	Semester	Frequency	Duration	Language
Intensive Module Theses in Science and Engineering (Intensivmodul: Abschlussarbeit Naturwissenschaften A oder B)	5 CP	Winter/ Summer	s. SCHREIBZENTRUM	1 Semester	German

From the catalogue of the faculty of Economic Sciences (Wirtschaftswissenschaft) :

Module	Credits	Semester	Language
Fundamentals of Finance and Investment (Corporate Finance I: Finanzierung & Investition)	5 CP	Summer	German
Financial Risk Management (Corporate Finance II: Finanzielles Risikomanagment)	5 CP	Summer	German
Capital Market Theory (Corporate Finance III: Kapitalmarkttheorie)	5 CP	Winter	German
Basics of Starting a Business (Start-Up I: Grundlagen der Existenzgründung)	5 CP	Winter	German
Coaching-Workshop for Start-Ups (Start-Up II: Coaching-Workshop für Existenzgründer)	5 CP	Winter/Summer	German
Basics of Business Plan Preparation (Start-Up III: Grundlagen der Businessplanerstellung)	CP	Summer	German

Compulsory Modules

Modul 6 Project Management

	Credits	Workload	Semester	Cycle	Duration
	5 CP	150 h	from 1. Sem.	Summer	1 Semester
Courses a) Seminar Project Management b) Practical exercises Project Management			**Contact Hours** a) 50 h b) 50 h	**Self-Study** 50 h	**Group Size** a) 30 b) 30

Requirements for Participation
Formal None
Content None
Preparation None

Learning Outcomes
After successfully completing the module, the students

- are familiar with the basics of project management
- have a basic understanding of leading a team
- can plan a scientific project and guide its implementation
- can adhere to time and formal frameworks

Contents

a) The seminar dates serve on the one hand to teach the basic methodological skills for project and team management. On the other hand, results from the practical exercises are discussed and problems analysed. The focus is on the exchange of information and feedback from the module supervisor. Leadership protocols and progress reports are prepared.
b) In the practical exercises, the participants can apply the acquired knowledge to a group of Bachelor students and to guide them in the implementation of a SOWAS project or to a group of high school students and to guide them to GYPT (German Young Physicist Tournament). From the preparation of the exposés or of a feasibility study to the final presentation, the participants of this module support the SOWAS students or high school students both professionally and interdisciplinarily.

Format of Teaching Seminar, practical exercises

Format of Examination Presentation, active participation

Requirements for the Attribution of Credit Points active participation in the seminar (>75 %), active participation in the exercises (> 75 %)

Use of the Module Mandatory Module

Importance of the Mark for the final grade The module is unmarked and not included in the final grade

Module Supervisor and Instructor Dean of Studies, Dr. Fornefeld, Prof. Dr. Krabbe, Dr. Möller

Modul 7 Methods and Project Planning

	Credits	Workload	Semester	Cycle	Duration
	15 CP	450 h	from 3. Sem.	Winter & Summer	1 Semester

Courses	Contact Hours	Self-Study	Group Size
a) Practical exercises b) Seminar	a) 320 h b) 30 h	100 h	a) 30 b) 30

Requirements for Participation

Formal Admission to the master's thesis has been granted, i.e. academic achievements amounting to at least 50 CP must be proven (including an elective module from experimental physics (9 CP), an in-depth module from theoretical physics (6 CP), the specialisation module (15-25 CP) and the compulsory module "project management" (5 CP)). If the thesis is to be written in the minor subject, at least 15 CP from the minor subject must be proven.

Content None

Preparation None

Learning Outcomes

After successfully completing the module, the students

- are immediately familiar with the experimental equipment, theoretical models and computer codes from their subject area
- have a deeper understanding of the scientific issues in their chosen field of specialisation
- are familiar with the most important concepts of time management and project work
- can plan the upcoming master's thesis in terms of time and content

Contents

a) In the practical exercises, the required concrete working methods of the group are learned. After an intensive familiarisation phase, the students can participate in the concretisation of their topic for the master's thesis. In addition, a timetable for the implementation of the master's thesis is drawn up and its feasibility is checked.

b) The seminar serves to develop a concrete topic for the master's thesis. At the beginning of the seminar, various topics are given out by the supervisors. Individual topics are developed within the seminar series.

Format of Teaching Practical exercises, Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Active participation in the exercises, individual presentation

Use of the Module Mandatory Module

Importance of the Mark for the final grade The module is unmarked and not included in the final grade

Module Supervisor and Instructor Professors and private lecturers of the Faculty of Physics and Astronomy. Upon application, other examiners may be admitted if necessary.

Further Information The module belongs to the module "master's thesis" in terms of content and subject matter. Both modules are completed with the same lecturer. With the admission to the master's thesis, the preparation period of 3 months begins, which includes the module "Knowledge of Methods and Project Planning (M.Sc.)". At the end of the preparation period, the module certificate must be submitted to the examination office together with a topic proposal.

You can find the list of current thesis supervisors in our Moodle course "Physikstudium-Info".

Modul 8 Project Seminar for the Master's Thesis

Module 8	Credits	Workload	Semester	Cycle	Duration
	15 CP	450 h	3. & 4. Sem.	Winter & Summer	2 Semesters
Courses a) Seminar A b) Seminar B			**Contact Hours** a) 100 h b) 30 h	**Self-Study** 320 h	**Group Size** a) 30 b) 30

Requirements for Participation
Formal Proof of completion of the module "Knowledge of Methods and Planning a Project"
Content None
Preparation None

Learning Outcomes
After successfully completing the module, the students
- can document the status of their project "Master's thesis" (on a weekly and monthly scale)
- can analyse successes, problems and difficulties and work out suggestions for the next project step
- have a basic understanding of how to communicate subject content appropriately (orally and in writing)

Contents
a) Seminar A takes place weekly, also during the lecture-free period. Each student first reports on the results of the previous week and analyses the progress and difficulties. The result of this analysis should be the starting point for further planning. The explanations or arguments can be supported by graphs or a presentation. The group discusses the feasibility in terms of time and con- tent with the aim of designing the next work steps as effectively as possible.
b) In seminar B, the project "Master's thesis" is presented in the respective working group. The presentation can be given either in the middle of the Master's thesis as an "interim report" or at the end as a "final report". The individual project phases as well as the time planning and implementation are in the foreground in addition to the focal points of the content.

Format of Teaching Seminar

Format of Examination Presentation

Requirements for the Attribution of Credit Points Active participation in the exercises, individual presentation

Use of the Module Mandatory Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Professors and private lecturers of the Faculty of Physics and Astronomy. Upon application, other examiners may be admitted if necessary.

Further Information This module is taken at the same time as the module "Master's thesis" and is taken with the same lecturer. The module certificate is submitted to the examination office together with the thesis. You can find the list of current thesis supervisors in our Moodle course "Physikstudium-Info".

Modul 9 Master’s Thesis

Module 10	Credits 30 CP	Workload 900 h	Semester 3. & 4. Sem.	Cycle Winter & Summer	Duration 2 Semester
Courses Thesis			**Contact Hours** 720 h	**Self-Study** 180 h	**Group Size** 1

Requirements for Participation

Formal Proof of completion of the module “Knowledge of Methods and Planning a Project”

Content None

Preparation None

Learning Outcomes

After successfully completing the module, the students

- have a deeper understanding of scientific ways of thinking and working
- can analyse physical questions and solve defined problems using scientific methods within a given period
- are aware of the requirements of an appropriate, written presentation of demanding and novel scientific results
- are familiar with the most important concepts of independent work organisation
- are familiar with adequate literature research, citation of sources and the principles of good scientific practice

Contents

Independent construction of an experiment or a theoretical model, independent planning and execution of the experiments or calculations/simulations, analysis of the results, optimisation of the processes, documentation of the process steps.

The topic and task must be formulated in such a way that they can be completed within 9 months with a workload of 30 CP.

Format of Teaching

Format of Examination Writing a scientific paper

Requirements for the Attribution of Credit Points Passing the examination

Use of the Module Mandatory Module

Importance of the Mark for the final grade Weighted according to Credit Points

Module Supervisor and Instructor Professors and private lecturers of the Faculty of Physics and Astronomy. Upon application, other examiners may be admitted if necessary.

Further Information The Master's thesis must be written in the chosen physics focus on which the focus module was completed. In addition, it is possible to write the thesis in a minor subject upon application. You can find the list of current thesis supervisors in our Moodle course "Physikstudium-Info".
