

Faculty of Physics and Astronomy

**Module Manual**  
**Master of Science (M.Sc.) in Physics**

**PO 2021 and PO 2023**  
Ruhr-Universität Bochum

WiSe 24/25  
16.12.2024

The Master of Science in Physics programme has a standard period of study of 4 semesters and a total of 120 credit points (CP). The study programme is divided into different areas. In the first year compulsory elective modules include in-depth modules from experimental and theoretical physics (15-36 CP) as well as diverse modules from the minor subject (5-18 CP). For the specialisation, courses amounting to 15-25 CP must be chosen in one subject area (astronomy/astrophysics, biophysics, solid state physics, nuclear and particle physics or plasma physics). In the area of key competences the obligatory module “project management” has to be chosen and further modules of up to 10 CP can be selected. A list of the approved modules can be found in this module handbook. In the second year compulsory modules amounting to 60 CP cover the subject-specific and interdisciplinary preparation and execution of the final thesis.

The distribution of the 120 CP to be completed in the physics degree programme is illustrated in the following table:

| Master of Science | Semester | Experimental physics  | Theoretical physics   | Focus area  | Minor subject   | Key qualifications             | Master's thesis                           |
|-------------------|----------|---|---|---|---|--------------------------------|---|
|                   |          | 9-18 CP   | 6-18 CP   | 15-25 CP  | 5-18 CP   | 5-15 CP                        | 60 CP                                     |
| First year        | 1        | Elective modules experimental physics (astro/bio/solid state/nuclear and particle/plasma) | Elective modules theoretical physics (thermodynamics and statistical/advanced quantum mechanics/general relativity) | Specialised lecture/seminar/advanced lab work (astro/bio/solid state/nuclear and particle/plasma) | Physics-related courses of other faculties (e.g. math, engineering, etc.) | e.g. C++ or Scientific Writing |   |
|                   | 2        | Elective modules experimental physics (astro/bio/solid state/nuclear and particle/plasma) | Elective modules theoretical physics (astro/solid state/plasma)   | (oral exam 2 CP)  | Physics-related courses of other faculties (e.g. math, engineering, etc.) | Project management             |   |
| Second year       | 3        |   |   |   |   |                                | Knowledge of methods and project planning |
|                   | 4        |   |   |   |   |                                | Project seminar for the Master's thesis   |
|                   |          |   |   |   |   |                                | Master's thesis                           |

**Key**

- Experimental physics
- Theoretical physics
- Focus areas
- Minor subject
- Key qualifications (choice)
- Key qualifications (oblig.)
- Master's thesis and preparatory courses

Actually two different examination regulations are in force:

- Students who have enrolled **by the summer semester 2023 at the latest** are in the 2021 examination regulations ([PO 2021](#))
- Students who have enrolled **from the winter semester 2023/2024** are in the examination regulations 2023 ([PO 2023](#))

The two examination regulations differ only minimally. The amended rules are marked in each case.

**This overview is structured as follows:**

1. counselling and information services
2. study plan
3. modularisation concept and examination forms
4. list of individual compulsory and elective modules

**1. Counselling and information services at the Faculty of Physics and Astronomy**

If you have any questions in connection with the subject of physics, please contact the student advisory service for physics. They offer appointments five days a week. There are no regular office hours, so you must make an appointment in person, by phone or by e-mail in advance.

Our student advisors for the Master's programme in Physics:

| <u>National Students</u>   | <u>International Students</u>  |
|--|--|
| <u>General Questions</u><br>Dr. Ivonne Möller<br>NB 02/169<br>Fon.: +49(0)234-32-29105<br><a href="mailto:moeller@physik.rub.de">moeller@physik.rub.de</a> | <u>General Questions</u><br>Dr. Andreas Kreyssig<br>NB 4/130<br>Fon.: +49(0)234-32-23648<br><a href="mailto:master-international@physik.rub.de">master-international@physik.rub.de</a> |
|  | <u>Admission process</u><br>Dr. Niklas Fornefeld<br>NB 02/171<br>Fon.: +49(0)234-32-2<br><a href="mailto:fornefeld@physik.rub.de">fornefeld@physik.rub.de</a>                          |

Before starting their studies, every student must attend a counselling appointment. In addition to individual appointments, group appointments are also offered. The students are informed about the appointments by e-mail.

General information and forms are provided in the Moodle course "Physics Study Info". After enrolment all students get access to the course.

## 2. Study plan:

| Modul                 | Description   | Semester | Exam  |
|-----------------------|---|----------|---|
| Modul 1.x<br>9 -18 CP | One (or two) elective module(s) from one of the following subject areas from experimental physics: astrophysics, biophysics, solid state physics, nuclear and particle physics or plasma physics.<br>Each module consists of a lecture with exercise as well as experiments from the advanced practical course from the respective subject area.  | 1.+2.    | graded, the partial performances achieved are weighted with the CP in the module grade.<br><br>One module from 1a to 1e (of choice) must be completed.<br><br>A further module can be taken.  |
| Modul 2.x<br>6 -18 CP | <b>PO 2021:</b><br>one (or three) module(s) from "Thermodynamics and Statistical Physics", "Advanced Quantum Mechanics" and "General Relativity"<br><br><b>PO 2023:</b><br>"Thermodynamics and Statistical Physics" has to be chosen, if it hasn't been chosen in the Bachelor already.<br><br>The modules "Advanced Quantum Mechanics" and "General Relativity" can be chosen in addition. | 1.+2.    | Graded, via a module final written exam or an oral examination.<br><br><b>PO 2021:</b><br>one module from 2a to 2c (at choice) must be completed.<br><br><b>PO 2023:</b><br>module from 2c must be completed.<br><br>Two further modules can be taken.<br><br>Graded, the partial performances achieved are weighted with the CP in the module grade. |
| Modul 3.x<br>0-12 CP  | One (or two) elective module(s) from one of the following subject areas from experimental physics: astrophysics, solid state physics or plasma physics.<br>Each module consists of a lecture with exercises.  | 1.+2.    | Graded, the partial performances achieved are weighted with the CP in the module grade.<br><br>One or two module(s) from 3a to 3c (at choice) can be completed.   |
| Modul 4.x<br>15-25 CP | One compulsory elective module from one of the following subject areas: Astrophysics, Biophysics, Solid State Physics, Nuclear and Particle Physics or Plasma Physics. Courses from experimental and/or theoretical physics from the respective subject area can be selected  | 3.+4.    | Graded, via a final oral module examination (2 CP).<br><br>A seminar (2 CP) and practicals (advanced lab work) (min. 5 CP) must be proven.  |

|                      |  |       |   |
|----------------------|--|-------|---|
| Modul 5.x<br>5-18 CP | Elective modules of 5- 18 CP from the catalogue of minor subjects (e.g. mathematics, chemistry, geosciences, ICAMS, neuroscience, engineering science). A complete list of all modules can be found further on in the module handbook. | 1.-4. | Graded, via a final module examination, final oral module examination, seminar lecture, study-related exercises and active participation, protocols, practical exercises or homework.   |
| Modul 6.x<br>0-10 CP | Elective modules in the amount of 0-10 CP from the area of key competences   | 2.+3. | Graded, via a module final examination, oral module final examination, seminar lecture, study-related exercises and active participation, protocols, practical exercises or term paper. |
| Modul 7<br>5 CP      | Project Management   | 1.+2. | ungraded, via active participation  |
| Modul 8<br>15 CP     | Methodology and Project Planning (M.Sc.)   | 3.    | ungraded, via active participation  |
| Modul 9<br>15 CP     | Project seminar for the Master's thesis  | 3.+4. | graded, via active participation and seminar talk   |
| Modul 10<br>30 CP    | Master thesis  | 3.+4. | graded, via two expert reports  |

### 3. Modularisation concept and forms of examination:

Examinations can take the form of a written examination, an oral examination, a seminar paper, a presentation, a term paper, a written report, a project, a practical exercise or a tutorial. The form of examination for each module can be found in the module descriptions. In the case of alternative options, a form of examination is determined by the lecturer at the beginning of the module.

All modules are completed with an examination. The compulsory modules "Project Management" and "Methodological Knowledge and Project Planning" remain ungraded. All graded modules are weighted with the CP in the final grade.

The "focus module" (compulsory elective modules 4.a to 4.e) concludes with an oral examination, which is credited with 2 CP. The following applies to all courses in the specialisation module:  
semester hour per week = CP.

The current range of courses offered by the Faculty of Physics and Astronomy can be found in CampusOffice.

All examinations at the Faculty take place in fixed examination periods. The first examination period is at the end of the lecture period, the second at the end of the lecture free period.

#### 4. List of all modules:

##### Modules 1 (Elective Modules from Experimental Physics)

- Module 1a Introduction to Astrophysics ..... 7
- Module 1b Introduction to Biophysics ..... 8
- Module 1c Introduction to Solid State Physics ..... 9
- Module 1d Introduction to Nuclear and Particle Physics ..... 11
- Module 1e Introduction to Plasma Physics ..... 13

##### Modules 2 (Elective Modules from Theoretical Physics)

- Module 2a General Relativity ..... 14
- Module 2b Advanced Quantum Mechanics ..... 15
- Module 2c Thermodynamics and Statistical Physics ..... 16
- **Quantum Mechanics for Internationals**

##### Module 3 (Elective Modules from Theoretical Physics)

- Module 3a Introduction to Theoretical Astrophysics ..... 17
- Module 3b Introduction to Theoretical Solid State Physics ..... 18
- Module 3c Introduction to Theoretical Plasma Physics ..... 19

##### Modules 4 (Elective Modules for the Focus Area)

- Module 4a Astrophysics ..... 20
- Module 4b Biophysics ..... 36
- Module 4c Solid State Physics ..... 39
- Module 4d Nuclear and Particle Physics ..... 59
- Module 4e Plasma Physics ..... 73

##### Modules 5 (Elective Modules from the Catalogue for Minor Subjects)

- Offers from the Faculty of Chemistry and Biochemistry ..... 84
- Offers from the Faculty of Geosciences ..... 85
- Offers from the Faculty of Electrical Engineering and Information Technology ..... 86
- Offers from the Faculty of Mechanical Engineering ..... 87
- Offers from the Faculty of Mathematics ..... 88
- Offers from the Faculty of Computer Science ..... 89
- Offers from ICAMS (Interdisciplinary Centre for Advanced Materials Simulations) ..... 90

##### Modules 6 (Elective Modules from the Area for Key Competences)

- Module 6a Computational Physics I ..... 91
- Module 6b Computational Physics II ..... 92
- Module 6c Scientific English ..... 93
- Module 6z List of further modules ..... 94

##### Compulsory Modules

- Module 7 Project Management ..... 95
- Module 8 Methodological Knowledge and Project Planning (M.Sc.) ..... 96
- Module 9 Project Seminar for the Master's thesis ..... 97
- Module 10 Master's Thesis ..... 98

| <b>Introduction to Astrophysics</b>   |                        |                          |   |                            |  |

| <b>Requirements for Participation</b><br><b>Formal</b> None<br><b>Content</b> Basic knowledge of Physics I-III (Bachelor) are highly appreciated<br><b>Preparation</b> None   |                        |                          |   |                            |  |
| <b>Learning Outcomes</b><br>After successfully completing this module, the students <ul style="list-style-type: none"> <li>• know the central concepts, theories and research fields of modern multi-wavelength and multi-messenger astrophysics.</li> <li>• are able to apply the different metrological and modelling methods of astrophysics to simple examples.</li> <li>• analyse and evaluate relevant scientific contents and communicate them in a differentiated manner, both orally and written.</li> <li>• know and motivate the significance of physics and astronomy for society and the importance of internationally cooperative research.</li> </ul>        |                        |                          |   |                            |  |
| <b>Contents</b><br>Methods and results of astrophysics are introduced using selected observational phenomena and presented in connection with the results from current research. The topics taught include, among others: Basics of observational cosmology, structure formation in the cosmos, active galactic nuclei, dark matter, radiation processes, radiation transport, gravitational lensing, stellar dynamics, state variables of stars, solar neutrinos, phases of the interstellar medium, accretion disk physics, pulsars. In the advanced laboratory course, basic scientific computing and programming skills are acquired on the basis of concrete problems. |                        |                          |   |                            |  |
| <b>Format of Teaching</b> Lecture, Exercises, Practical Exercises (Laboratory Course)   |                        |                          |   |                            |  |
| <b>Format of Examination</b> At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture. The advanced laboratory course is examined via practical exercises and protocols.   |                        |                          |   |                            |  |
| <b>Requirements for the Attribution of Credit Points</b> Depending on the specified form of examination: Passing the written/oral examination or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation in the exercise is also compulsory. The form of examination is determined at the beginning of the course. In addition, the advanced laboratory course must be successfully completed. Both grades go into the module grade with the CP-weighted.   |                        |                          |   |                            |  |
| <b>Use of the Module</b> Compulsory-Elective Module   |                        |                          |   |                            |  |
| <b>Importance of the Mark for the Final Grade</b> Weighted according to credit points   |                        |                          |   |                            |  |
| <b>Module Supervisor and Instructor</b> Prof. Dr. Bomans  |                        |                          |   |                            |  |
| <b>Further Information</b>  |                        |                          |   |                            |  |

| <b>Introduction to Biophysics</b>   |                        |                          |   |                            |  |
|---|------------------------|--------------------------|---|----------------------------|--|
| <b>Module 1b</b>  | <b>Credits</b><br>9 CP | <b>Workload</b><br>270 h | <b>Semester</b><br>from 1. Sem.                       | <b>Cycle</b><br>Winter     | <b>Duration</b><br>1-2 Semesters                   |
| <b>Courses</b><br>a) Lecture Introduction to Biophysics<br>b) Exercises for Introduction to Biophysics<br>c) Advanced Laboratory Courses for Physicists (three experiments in Biophysics)   |                        |                          | <b>Contact Hours</b><br>a) 44 h<br>b) 22 h<br>c) 21 h | <b>Self-Study</b><br>183 h | <b>Group Size</b><br>a) unlimited<br>b) 30<br>c) 2 |

| <b>Learning Outcomes</b><br>After successfully completing this module, the students <ul style="list-style-type: none"> <li>• Have a basic understanding of theoretical astrophysics</li> <li>• Are aware of the possibilities of the used mathematisation and modelling</li> <li>• Know the fundamental concepts for describing astrophysical environments</li> <li>• Are familiar with different theoretical methods</li> <li>• Can see and successfully apply correlations between astrophysics, respective examples and different branches of physics (nuclear and particle physics, plasma physics)</li> </ul>   |                        |                          |  |                            |  |
| <b>Contents</b><br>Methods and results of astrophysics are introduced for selected astrophysical systems and discussed in connection with current research results. Focal points are selected from the following topics: Astrophysics: definition and fundamentals (the latter are provided in short digressions as required); Stars: state variables, formation, structure, evolution and final states; Stellar winds: acceleration, structure and interaction with the interstellar medium; Stellar atmospheres: Structure and radiative transfer; Stellar winds: acceleration, structure and interaction with the interstellar medium; Milky Way, galaxies: structure; Cosmic rays: acceleration and transport. |                        |                          |  |                            |  |
| <b>Format of Teaching</b> Lecture, Exercises   |                        |                          |  |                            |  |
| <b>Format of Examination</b> At the beginning of the course, the lecturer determines the form of examination (written examination of 90 min, oral examination of 45 min or an exercise certificate with weekly homework and active participation in the exercises) for the lecture.  |                        |                          |  |                            |  |
| <b>Requirements for the Attribution of Credit Points</b> Depending on the defined form of examination: Passing the written/oral examination or obtaining at least 50 % of the possible points in the weekly exercises. In this case, active participation in the exercises is also compulsory. The form of examination is determined at the beginning of the course.   |                        |                          |  |                            |  |
| <b>Use of the Module</b> Compulsory-Elective Module  |                        |                          |  |                            |  |
| <b>Importance of the Mark for the Final Grade</b> Weighted according to Credit Points  |                        |                          |  |                            |  |
| <b>Module Supervisor and Instructor</b> Prof. Dr. Tjus   |                        |                          |  |                            |  |
| <b>Further Information</b>   |                        |                          |  |                            |  |

| <b>Introduction to Theoretical Solid State Physics</b>  |                |                 |                      |                   |                       |

| <b>Learning Outcomes</b><br>After successfully completing the module, the students <ul style="list-style-type: none"> <li>• have learned to apply physical knowledge from different fields (such as plasma and quantum physics) to the often 'exotic' conditions of space compared to Earth.</li> <li>• Have gained a basic understanding of the most important physical processes describing the different phenomena in the universe</li> <li>• know the basic theoretical concepts of modern astronomy and astrophysics</li> <li>• are informed about current astrophysical issues</li> <li>• are able to read, understand and classify astrophysical literature</li> <li>• are able to write their Master's thesis in the field of experimental or theoretical astronomy / astrophysics</li> </ul>   |                            |                              |  |                                 |   |
| <b>Contents</b><br>Modern astrophysical topics are introduced. In the process, the students are taken to the 'front line of research'. This is done with special emphasis on the research foci of the participating chairs and working groups in experimental and theoretical astrophysics/astronomy, but a broad overview is also provided. Extragalactic astronomy, up to (observational) cosmology and astroparticle physics, takes up a large amount of space. Interactions of different components (such as phases of the interstellar medium, galactic disk / halo or galaxies / intergalactic medium) are of particular importance. But also processes in our own Milky Way are presented in detail. Here, the focus is on the gas and dust components of the Milky Way and the formation of stars and - linked to this - planetary systems, but also on solar-terrestrial relationships, such as the physics of the solar wind. Close relations exist with plasma physics and nuclear and particle physics. |                            |                              |  |                                 |   |
| <b>Format of Teaching</b> Lecture, Exercises, Seminar, Laboratory Work  |                            |                              |  |                                 |   |
| <b>Format of Examination</b> Oral examination of 45 minutes   |                            |                              |  |                                 |   |
| <b>Requirements for the Attribution of Credit Points</b> Passing the oral examination.<br>The specialisation module must include: advanced laboratory courses (5 CP) and a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved.  |                            |                              |  |                                 |   |

Achievements made after the final module examination no longer count towards the module.

**Use of the Module** Compulsory-Elective Module

**Importance of the Mark for the Final Grade** Weighed according to Credit Points

**Module Supervisor** Prof. Dr. Bomans

**Examiners** Prof. Dr. Bomans, Prof. Dr. Dettmar, Prof. Dr. Franckowiak, Prof. Dr. Hildebrandt, Prof. Dr. Tjus, PD Dr. Fichtner

**Further Information** For advice and coordination of the courses, please contact the module supervisor.

| <b>Learning Outcomes</b><br>After successful completion of the module, students <ul style="list-style-type: none"> <li>• have an understanding of the properties of a homogeneous, isotropic universe</li> <li>• are aware of the physics of the thermal history of the universe</li> <li>• know the physical concepts of cosmic structure formation and the cosmic microwave background</li> <li>• are familiar with the basics of the inflationary universe, re-ionisation, gravitational lensing and galaxy evolution</li> <li>• are ready to work on a master thesis with a cosmological topic</li> </ul>   |                        |                          |  |                           |  |
| <b>Contents</b><br>The lecture starts with a description of the physics of homogeneous, isotropic universes, a.k.a. Friedmann-Lemaitre-Robertson-Walker universes. Their contents, past and future evolution, and observational avenues to constrain such models are discussed. Starting from the hot big bang, the thermal history of the universe is covered, connecting insights from particle physics, thermodynamics, and the above mentioned homogeneous, isotropic world models. Next, structure formation and evolution are discussed, starting from tiny primordial fluctuations all the way to the structures we see in the universe today. The cosmic microwave background (CMB) is introduced and understood based on these concepts. Cosmic inflation, re-ionisation, gravitational lensing and galaxy evolution are covered, always with a focus on connecting theoretical cosmology with observations. |                        |                          |  |                           |  |

|--|------------------------|-------------------------|---------------------------------|---------------------------|-----------------------------------|
|  | <b>Credits</b><br>3 CP | <b>Workload</b><br>90 h | <b>Semester</b><br>from 1. Sem. | <b>Cycle</b><br>Winter    | <b>Duration</b><br>1 Semester     |
| <b>Courses</b><br>a) Lecture The Milky Way and External Galaxies   |                        |                         | <b>Contact Hours</b><br>a) 33 h | <b>Self-Study</b><br>57 h | <b>Group Size</b><br>a) Unlimited |
| <b>Requirements for Participation</b><br><b>Formal</b> None<br><b>Content</b> None<br><b>Preparation</b> Solid knowledge of the foundations of Astronomy is necessary, as it is presented in the lecture „Grundlagen der Astronomie“. Previous attendance of the lecture „Introduction to Astrophysics“ is helpful, but not required.  |                        |                         |                                 |                           |                                   |
| <b>Learning Outcomes</b><br>After the successful completion of the course students will have gained a deeper understanding of structure, kinematics, and evolution of our Milky Way galaxy. Using these concepts, in the second part of the lecture the properties and evolution of external galaxies will be explored and a coherent picture for evolution of galaxies inside the evolving universe will be derived.  |                        |                         |                                 |                           |                                   |
| <b>Contents</b><br>The course consists of the two major parts: the exploration of the physical properties of our Milky Galaxy and the extension to the various types of external galaxies, both the underlining goal to derive a consistent picture for the evolution of galaxies from the early universe to today. Methods and results for the structure, kinematics, star formation history, and chemical evolution will be presented and applied to the different galaxy types and conclusions for the evolution of the galaxy types derived. |                        |                         |                                 |                           |                                   |
| <b>Format of Teaching</b> Lecture  |                        |                         |                                 |                           |                                   |
| <b>Format of Examination</b> Usually a short oral presentation, alternatively (if special conditions apply) a written essay or an oral exam  |                        |                         |                                 |                           |                                   |

| <b>Learning Outcomes</b><br>After successful completion of the module students <ul style="list-style-type: none"> <li>• have a broad overview of state-of-the-art topics in multi-messenger astrophysics</li> <li>• know how to present their work to an international group of experts</li> <li>• learn to participate in the discussion among international experts</li> <li>• have acquired the skillset to complete their bachelor / master theses</li> </ul>   |                        |                         |                                 |                                 |                                   |
| <b>Contents</b><br>This weekly seminar brings together the members of the multi-wavelength astrophysics group. It covers topics of neutrino astronomy, gamma-ray astronomy, optical astronomy and numerical modelling of multi-wavelength data. We discuss recent papers concerning the topic and members of the group regularly present their work. The students get first insights into the inner workings of large collaborations, have opportunities to interact with international colleagues and present their work to the group. |                        |                         |                                 |                                 |                                   |

| <b>Courses</b><br>a) Seminar Selected Topics of Astronomy  |                        |                         | <b>Contact Hours</b><br>a) 22 h | <b>Self-Study</b><br>38 h       | <b>Group Size</b><br>a) Unlimited |
| <b>Requirements for Participation</b><br><b>Formal</b> Yes<br><b>Content</b> Yes<br><b>Preparation</b> Solid knowledge of the foundations of Astronomy is needed, as presented in the lecture „Grundlagen der Astronomie“ and attendance of the lecture „Introduction to Astrophysics“ highly recommended. Previous attendance of more specialized Astronomy/Astrophysics lecture is recommended, but not required.  |                        |                         |                                 |                                 |                                   |
| <b>Learning Outcomes</b><br>The seminar is intended to give the students exposure to cutting edge Astronomical/Astrophysical science topics, train the understanding of research papers, the presentation of science results at the knowledge level of their fellow students, and discuss them following each of the presentations. (This requires the participation in at least most of the seminar dates.)   |                        |                         |                                 |                                 |                                   |
| <b>Contents</b><br>In the seminar the students select from a list of topical papers the one to present. The topics are selected by the full-time lecturers and therefore reflect mostly the work topics actively pursued at the Astronomical Institute. With help of the respective advisors the students prepare the topics to be presented in their seminar talk and are provided with help for the actual presentation. Result of presenting one talk, plus listening and discussing the other talks of the seminar will provide a view of some topical research in Astronomy/Astrophysics. |                        |                         |                                 |                                 |                                   |

| <b>Learning Outcomes</b><br>Students will get a broader view on the stellar evolution and consequences of mass loss. Mainly from an observational perspective but also theoretical concepts are introduced and discussed.   |                        |                         |                                 |                           |                                   |
| <b>Contents</b><br>The course concentrates on stellar evolution of stars of all masses. A focus is given on the parameters that influence the evolution – in particular the stellar mass loss and its consequences. The lecture addresses the topic from an observational point of view but also theoretical models presented. Beside the observational characteristics also the mechanism of stellar winds are addressed. The formation of circumstellar nebula from stellar winds and possible shell ejections is another topic of the lecture. In this context the lecture briefly tackles several concepts and properties of the Interstellar medium. |                        |                         |                                 |                           |                                   |

| <b>Requirements for Participation</b><br><b>Formal</b> Preparation of content<br><b>Content</b> Will be provided<br><b>Preparation</b> Participation in module "Special Problems in Applied Solid State Physics" is recommended. Preparation of the content will be checked in advance.  |                        |                          |                                 |                           |  |
| <b>Learning Outcomes</b><br>After successful completion of the module <ul style="list-style-type: none"> <li>• students have a basic understanding of how semiconductor devices are made from semiconductor chips. And how these functions are tested.</li> <li>• Students are aware of the capabilities of photo-lithography, device testing setups, focused ion implantation.</li> <li>• students know the basic concepts of semiconductor devices</li> <li>• are familiar with photo lithography</li> </ul>   |                        |                          |                                 |                           |  |
| <b>Contents</b><br>In the practical course, students independently produce a simple field-effect transistor. Basic techniques of semiconductor processing, such as photolithography and wet chemical etching, are learned. Furthermore, students will use focused ion implantation to modify the electrical properties of semiconductor heterostructures. The electrical characterization of the fabricated devices is another focus of the lab. Here, modern, electrical measurement techniques are used for device characterization. Each practical day is introduced with a lecture of about 45 minutes, in which the basics for the work of the day are explained. |                        |                          |                                 |                           |  |
| <b>Format of Teaching</b> Lab course and lecture   |                        |                          |                                 |                           |  |
| <b>Format of Examination</b> Oral exam about content and plan how to measure the device (midterm during the week). Presentation after the practical.   |                        |                          |                                 |                           |  |
| <b>Requirements for the Attribution of Credit Points</b> Successful oral exam and presentation.  |                        |                          |                                 |                           |  |

| <b>Contents</b><br>In this journal club we gather weekly to discuss recent relevant research published in scientific journals. One participant of the club presents a summary of the chosen paper that the whole group has read. Then, the content is discussed. Attendees ask clarifying questions, discuss different aspects of the experimental design, critique the methods, judge the writing style, and bring a healthy amount of scepticism (or praise) to the results.  |                        |                         |                                 |                                 |                                   |

| <b>Contents</b><br>Quantum materials are materials whose properties are decisively determined by quantum mechanics. As a part of condensed matter physics, this seminar will provide insight into some of the most famous quantum materials such as heavy fermion systems, high-temperature superconductors and topological materials. In addition to these important concepts of condensed matter physics, we will also get to know a range of experimental techniques that were used to find out about them. Thus, we will get insight into the process of understanding a new material in condensed matter physics and the critical analysis of experimental results and their interpretations. |                        |                         |                                 |                           |                                   |

| <b>Contents</b><br>This course will cover the physics necessary to understand quantum cascade lasers. Quantum cascade lasers are a new class of semiconductor lasers that are based on intersubband transitions. They emit radiation at mid-infrared and far-infrared wavelengths. This contrasts with conventional diode semiconductor lasers which are based on interband transitions and emit radiation at visible and near-infrared wavelengths. The active region of a quantum cascade laser consists of repeating series (cascades) of quantum wells and barriers that are grown in Molecular Beam Epitaxy (MBE) or Metal Organic Vapor Deposition (MOCVD) machines. To achieve lasing, wavefunctions and levels should be designed to maximize/(minimize) the lifetime of the upper/(lower) laser level, reduce parasitic scattering, maximize injection into the upper laser level, and minimize losses. This requires a thorough understanding of the optical properties of two-dimensional semiconductors, and electron transport and scattering in semiconductor heterostructures. In addition to these topics, the course will review basic laser theory and survey different types of waveguides.   |                        |                         |  |                           |                                   |
| <b>Outline</b><br><br><b>Basic Laser theory:</b> spontaneous emission, stimulated emission, absorption, Einstein A and B coefficients, Rate equations, 3 and 4 level laser systems, laser threshold, gain clamping / saturation, homogeneous and inhomogeneous broadening, multi-mode and single mode lasers, spatial hole burning, longitudinal and transverse modes, spontaneous emission noise and laser line width, frequency pulling, Q-switching, mode-locking line width, different types of lasers.<br><b>Wave functions and effective mass:</b> Review of tight binding model, nearly free-electron model, and the formation of bands. Bloch's theorem, envelope approximation, effective mass approximation, hetero-structure effective mass theory - modifications of the continuity conditions and the kinetic operator in the envelope approximation<br><b>Idealized potentials</b> parabolic well, infinite square well, finite square well, finite hetero-structure square well, superlattices and minibands, Bloch oscillations, coupled quantum wells, Stark effect<br><b>Refinements of effective mass theory:</b> $k \cdot p$ method, Kane 2 and 3 band models, non-parabolicity<br><b>Optical properties of quantum wells:</b> Interband and intraband transitions, absorption in quantum wells, selection rules, oscillator strength – sum rules, depolarization shift, gain and loss, modification of sum rules and transition dipole moments from non-parabolicity<br><b>QCL design strategies:</b> two-dimensional rate equations, slope efficiency, importance of lifetimes, parasitic scattering, Bragg confinement, resonant tunneling (qualitative treatment), backfilling and |                        |                         |  |                           |                                   |

|   |
|---|
| <p>self-heating, bound-to-continuum designs, LO-phonon designs, chirped super-lattice and phase space designs</p> <p><b>Resonant tunneling injection and extraction:</b> coupled quantum wells, resonant tunneling diodes, density matrix - two and three-level models, coherent and incoherent transport regimes, scattering assisted injection, electric field domains</p> <p><b>Carrier scattering:</b> phonon scattering, electron-electron scattering, impurity scattering, interface roughness, elevated electron temperatures</p> <p><b>Waveguides/mode confinement:</b> TE and TM modes, dielectric slab waveguides, surface plasmon waveguides, photonic crystals, distributed bragg reflectors, mode coupling, orthogonality/completeness of modes, mode overlap factor</p> |
| <p><b>Format of Teaching</b> Lecture and exercise/discussion session</p>  |
| <p><b>Format of Examination</b> Weekly exercises will be assigned. Students are expected to write notes on the lecture material. The grade for the course will be based on a final examination.</p>   |
| <p><b>Requirements for the Attribution of Credit Points</b> Active participation during the weekly lecture and exercise session is required. Students are required to submit weekly exercises and handwritten lecture notes to Module. The final examination will be written and take approximately 90 minutes to complete. A single grade will be given for both the lecture and exercises.</p>  |
| <p><b>Use of the Module</b> Courses in Physics Major</p>  |
| <p><b>Importance of the Mark for the Final Grade</b> The grade will be determined by the final examination.</p>   |

| <b>Contents</b><br>Students will learn to describe the basic elements of electron microscopes (electron guns, electromagnetic lenses, electron detectors) and are able to understand the particle and wave nature of electron optics. The course will explain the fundamental mechanisms of electron specimen interactions with a focus on elastic and inelastic scattering. Details of image formation mechanisms related to scattering and phase contrast will be described to be able to interpret image contrast formation. The basic theory of electron scattering and diffraction will be explained and will be demonstrated by experimental examples. The course will provide first insights into spectroscopic techniques and how they can be used to analyse the composition and electronic structure of solid state materials. |                        |                         |                                 |                           |                                   |

| <b>Contents</b><br>The ability to create semiconductor heterostructures by combining different constituents from the periodic table of elements in perfect crystalline arrangements is a huge technological leap. It enabled the creation of highly efficient and miniaturized optoelectronic devices like laser light sources and ultrafast electronic components. Key to this is the control of the arrangement of the crystal matrix elements and dopants resulting in the band structure, the spatial arrangement of the electrostatic potential and (quantized) energy states of carriers. In the seminar we will calculate the quantized states and the band structure of different devices like quantum wells, high electron mobility transistor and diode structures. The structures developed in practical exercises will be in close relation to structures used for quantum experiments with e.g. qubit, single photon source, and single electron source Leviton devices. |                        |                         |                                 |                                 |                                   |

| <b>Learning Outcomes</b><br>After successful completion of the module <ul style="list-style-type: none"> <li>• students have developed a basic understanding of the modern topics of the solid state theory</li> <li>• Students are able to work independently with the modern literature on theoretical and experimental solid state physics and make scientific presentations on a given topic</li> <li>• students know the basic concepts of solid state theory and can use them to understand and to comprehend new scientific articles</li> </ul> |                        |                         |                                 |                           |                               |
| <b>Contents</b><br>Brief description of the subject content: <ul style="list-style-type: none"> <li>- topological band theory and its application to the novel quantum materials</li> <li>- basics of the quantum information and qubits realization</li> <li>- concepts of Phase Transitions and broken symmetry</li> <li>- Coherent states and path integrals,</li> <li>- Superconductivity and BCS theory</li> </ul>  |                        |                         |                                 |                           |                               |
| <b>Format of Teaching Seminar</b>  |                        |                         |                                 |                           |                               |
| <b>Format of Examination</b> The seminar is examined via a presentation by the student on the selected topic, related to the modern research.  |                        |                         |                                 |                           |                               |
| <b>Requirements for the Attribution of Credit Points</b> Depending on the defined form of examination: Passing the written/oral examination or obtaining at least 50 % of the possible points in the weekly exercises. In this case, active participation in the exercise is also mandatory. The form of examination will be determined at the beginning of the course. In addition, the F practical course must be completed successfully. Both grades go into the module grade with the CP weighted.   |                        |                         |                                 |                           |                               |

| <b>Contents</b><br>Talks and discussions on actual topics of applied solid state research. In particular, molecular beam epitaxy and focused ion beam technology including the preparation of semiconductor devices and technical aspects of the applied instruments/machines. An important issue is the creation of ultra-high vacuum for most of the preparative techniques. Frequently discussed subjects are quantum devices like single photon sources, quantum dots and low-dimensional electrical carrier systems in general.  |                        |                         |                                 |                                 |                                   |

| <b>Learning Outcomes</b><br>After successfully completing the module, the students <ul style="list-style-type: none"> <li>• understand both how the Standard Model of particle physics was developed and its predictive power</li> <li>• can make the connection between quantum field theory predictions and experiments</li> <li>• have a deeper understanding of the electromagnetic, weak and strong interactions</li> <li>• are familiar with and can interpret Nobel Prize experiments in nuclear and particle physics</li> <li>• are able to make the connection between symmetries and experimental observations</li> <li>• possess a knowledge of open questions and current research topics in the field of nuclear and particle physics</li> <li>• can explain the connection between particle physics and the development of the universe</li> </ul> |                            |                              |  |                                 |   |
| <b>Contents</b><br>Dirac equation, spin, antiparticles, conservation laws, Feynman diagrams, Yukawa interaction, strangeness, group theory and symmetry, Clebsch-Gordon coefficients, meson nonets, Breit-Wigner resonances, colours in QCD, charm, confinement, Global and local symmetries, hadron structure, parton model, deep inelastic scattering and scale behaviour, neutrino physics, weak WW, mixing states, Higgs mechanism of mass production, physics beyond the Standard Model, quantum field theories, solitons. In addition, special events are offered in the form of lectures and seminars on detectors, hadron physics, neutrino physics, as well as theoretical nuclear and particle physics or other current topics. Practical experiments complement the theoretical knowledge.  |                            |                              |  |                                 |   |
| <b>Format of Teaching</b> Lecture, Exercises, Seminar, Laboratory Work   |                            |                              |  |                                 |   |
| <b>Format of Examination</b> Oral examination of 45 minutes  |                            |                              |  |                                 |   |
| <b>Requirements for the Attribution of Credit Points</b> Passing the oral examination. The specialisation module must include: advanced laboratory courses (5 CP), a seminar (2 CP). Including the final oral module examination (2 CP), 15-25 CP can be achieved. Achievements made after the final module examination no longer count towards the module.  |                            |                              |  |                                 |   |
| <b>Use of the Module</b> Compulsory-Elective Module  |                            |                              |  |                                 |   |
| <b>Importance of the Mark for the Final Grade</b> Weighted according to Credit Points  |                            |                              |  |                                 |   |
| <b>Module Supervisor</b> Prof. Dr. Wiedner, Prof. Dr. Epelbaum   |                            |                              |  |                                 |   |
| <b>Examiner</b> Prof. Dr. Epelbaum, Prof. Dr. Fritsch, Prof. Dr. Heinsius, Prof. Dr. Tjus, Prof. Dr. Wiedner, PD Dr. Krebs   |                            |                              |  |                                 |   |

**Further Information** For advice and coordination of the courses, please contact the module supervisor. Please see the [course list](#) below.

| <b>Learning Outcomes</b><br>After successfully completing the module, the students will be able to: <ul style="list-style-type: none"> <li>• understand the role and importance of data analysis in high-energy physics experiments</li> <li>• apply basic and advanced statistical methods to particle physics data</li> <li>• perform parameter estimation and hypothesis testing using real experimental data</li> <li>• analyse and interpret uncertainties in experimental measurements</li> <li>• utilize machine learning techniques for classification of particle reactions</li> <li>• fit theoretical models to experimental data and evaluate quality of the fit</li> <li>• gain hands-on experience with LHCb data and particle-physics analysis tools</li> <li>• learn basics of Julia programming language</li> <li>• complete an independent data analysis project, demonstrating the application of learned techniques</li> <li>• present and effectively communicate analysis results to peers.</li> </ul>   |                        |                         |  |   |  |
| <b>Contents</b><br>This course provides a comprehensive journey from statistical modelling to advanced data analysis techniques, incorporating elements of modern research workflows in particle physics. Students will learn core topics such as probability distributions, parameter estimation, hypothesis testing, uncertainty analysis, multivariate techniques, and machine learning for particle classification, alongside model fitting and evaluation. Weekly lectures will be followed by hands-on application to a freshly collected dataset from the LHCb experiment in 2024. Students will progressively build their skills by analysing real research data, fitting theoretical models, and interpreting uncertainties. The course also introduces Julia programming to equip students with modern computational tools. Bi-weekly tutorials will serve as hackathon-style workshops, providing direct support for advancing coding projects and preparing for upcoming tasks. By the end, students will complete an independent data analysis project and present their findings, demonstrating their proficiency in high-energy physics data analysis. |                        |                         |  |   |  |

| <b>Contents</b><br>This course in Hadron Physics is an extensive program designed to provide students with a fundamental and practical understanding of Quantum Chromodynamics (QCD) in a confined regime of hadronic matter. Beginning with the introduction to the basics of QCD, including quarks, gluons, colour confinement, asymptotic freedom, and gauge invariance, the course sets a solid theoretical foundation. It then progresses into a detailed study of hadron classification and structure, covering baryons, mesons, the quark model, and flavour symmetry. A significant portion of the course is devoted to experimental techniques in hadron physics, with a focus on particle detectors, and data processing, particularly LHCb, COMPASS, and BES experiments. This includes practical aspects of event generation, detection, and data analysis, alongside addressing common experimental challenges. Spectral analysis and reaction theory is explored, elucidating particle interaction, resonance phenomena. Students will also delve into the spectroscopy of hadrons, learning about excitation spectra of mesons and baryons, as well as exotic structures like tetraquarks, pentaquarks, glueballs, and hybrids. Theoretical tools and computational methods will be discussed in the second half of the course. The course also addresses current and future experiments in hadron physics, exploring their role in the broader context of particle physics and discussing heavy flavour physics, including heavy quarks, CP violation, and B-meson physics. Finally, the course wraps up with ethical and practical considerations in research, offering guidance on collaboration in large-scale experiments, student projects, research opportunities, and career paths in hadron physics. |                        |                          |  |                           |  |
| <b>Format of Teaching</b> Lecture, exercises   |                        |                          |  |                           |  |
| <b>Format of Examination</b> An oral examination based on a demonstration of the solution to a problem   |                        |                          |  |                           |  |

|  |  |
|--|--|
| <b>Requirements for the Attribution of Credit Points</b> | Active participation (> 50 %) in exercise classes, presentation of the homework problem at the board at least two times during the semester, oral exam of 30 minutes based on a problem communicated a week before the exam. The form of examination will be determined at the beginning of the course.  |

| <b>Contents</b><br>In this seminar, students are assigned a specific topic related to hadrons physics at Large Hadron Collider. Throughout the semester, they conduct an in-depth study of their topic following recent scientific publications. The first half of the course is dedicated to independent research, while students receive guidance and feedback from the instructor. In the second half, students present their findings to the group in a series of scientific presentations. These sessions are followed by open discussions. |                        |                         |                                 |                                 |                                   |

| <b>Learning Outcomes</b><br>After a successful completion of the module <ul style="list-style-type: none"> <li>• Exists an over view over the Standard Model of Particle Physics.</li> <li>• Can students describe the most important phenomena</li> <li>• Are students acquainted with the experimental methods and techniques.</li> <li>• Students have the knowledge of the basic principles of detectors for subatomic particles.</li> <li>• Is the connection between theory and experiment clear.</li> </ul>  |                        |                          |  |                           |  |
| <b>Contents</b><br>Students will learn of the fundamental theoretical and experimental tools that lay the foundations of modern particle physics. The course will explain the connection between symmetries and quantum numbers. Details of the strong and weak interaction will be presented and their experimental observation in a historical context discussed. Important experimental discoveries and their consequences for the development of the field are part of the course including important breakthroughs like the discovery of the Higgs boson or the observation of neutrino oscillations. Also included is a look into the future to address open questions and the planned experiments and their goals. |                        |                          |  |                           |  |
| <b>Format of Teaching</b> Lectures, exercises and short presentations of the students   |                        |                          |  |                           |  |
| <b>Format of Examination</b> Successful and regular participation in the exercise classes. In the homework section at least 50% of all possible points. Students are asked to present solutions to the problems at least twice during the semester to the group and are asked to present a short summary of the previous lecture twice.   |                        |                          |  |                           |  |
| <b>Requirements for the Attribution of Credit Points</b> Depending on the defined form of examination: The students need to obtain at least 50% of the possible points in the weekly practice assignments and participate actively in the discussion of the exercises. Also, twice a short summary of the previous lecture will be presented in class. In addition, the advanced practical exercises (F-Praktikum) are required. The grades from the lectures/exercises and the lab course enter both the grade of the module.  |                        |                          |  |                           |  |

| <b>Learning Outcomes</b><br>After successful completion of the module, students will <ul style="list-style-type: none"> <li>• have a basic understanding of kinetic and statistical methods in plasma physics</li> <li>• be aware of possibilities related to non-local and resonant effects</li> <li>• know the basic concepts of the statistical description of plasmas</li> <li>• be familiar with the respective physical concepts and the mathematical methods</li> <li>• be able to recognize the relation between temporal and spatial structures and their consequences for heating and transport</li> </ul>  |                        |                          |                                 |                           |                                   |
| <b>Contents</b><br>Plasma are many particle systems and, therefore, many phenomena cannot be described by the common fluid picture. In the course, the standard description by the Boltzmann equation is revisited in detail but a strong focus will be on alternative statistical concepts like the master equation, the Fokker-Planck equation and the Langevin equation. The concepts are derived from first principles and are then applied to describe basic plasma phenomena. These include, electron Landau damping, local and non-local electron heating in ICPs and the INCA discharge and non-local ion transport under charge exchange collisions. Mathematical methods as well as physical pictures and concepts are introduced. The theoretical concepts are complimented by experimental results. |                        |                          |                                 |                           |                                   |

| <b>Learning Outcomes</b><br>After successful completion of the module, students will <ul style="list-style-type: none"> <li>• have a basic understanding of MHD turbulence and reconnection</li> <li>• are familiar with turbulent flows and magnetic reconnection</li> </ul>   |                        |                         |                                 |                           |                                   |
| <b>Contents</b><br>The MHD conservation laws are derived, after which some instabilities (Kelvin-Helmholtz, Rayleigh-Taylor, tearing, ...) are discussed. Subsequently, the MHD turbulence is introduced (Reynolds MHD, Esässer variable, ...). This is followed by the spectral properties (cascades, homogeneous and anisotropic turbulence, ...) and intermittency. Based on this, magnetic reconnection is introduced. The topology change as well as 2D and 3D reconnection are described. Current layers, SweetParker and Petschek reconnection are described in detail. In particular, shock-free reconnection is discussed. |                        |                         |                                 |                           |                                   |

| <b>Contents</b><br>The lecture summarises the basics of the atomic models of plasma spectroscopy. At first, relevant topics of atomic physics are explained, which are necessary for the understanding of the most important atomic processes. Previous knowledge from quantum mechanics is deepened. The most important processes are dealt with, which represent the foundation of plasma spectroscopy. Examples are taken from fusion and laboratory experiments and from astrophysics. The knowledge gained is partly supported by practical exercises using freely available atomic codes such as FLYCHK, FAC, or AUTOSTRUC-TURE, so that the listeners become familiar with the current status of atomic models and can apply them to their specific problems in research if required.  |                        |                          |  |                           |  |

| <b>Contents</b><br>The lecture introduces the fundamentals of optical plasma diagnostics. The essential plasma and atomic physical concepts are introduced. The lecture begins with the presentation of measurement and analysis of electrical parameters e.g., from a probe measurement. The spectroscopic methods are explained in detail, the parameters that can be directly and indirectly derived from them, e.g., electron density and temperature, are discussed, and the respective area of application as well as the limits of the methods are shown. Particular emphasis is also placed on teaching the experimental methodology, i.e., the mode of operation and use of optical components and devices. Finally, in addition to the optical methods, energy-resolved mass spectroscopy for the detection of atoms, molecules and ions is also dealt with. |                        |                          |  |                           |                               |

| <b>Learning Outcomes</b><br>After successfully completion of the course <ul style="list-style-type: none"> <li>• students have a basic understanding of equilibrium and non-equilibrium processes in plasma chemistry</li> <li>• are aware of the possibilities plasma interactions offer for surface modifications and material processing</li> <li>• students know the basic concepts of thermodynamics, kinetics, and reaction mechanisms in plasma environments</li> <li>• are familiar with the mathematical description of kinetic models for plasma reactions and transport processes</li> <li>• students are able to recognize connections between plasma chemistry and surface reactions, and apply this knowledge to real-world applications such as plasma etching and deposition</li> </ul> |                        |                         |  |                           |  |
| <b>Contents</b><br>This course provides an introduction to the fundamental principles of plasma chemistry, focusing on the interaction between plasma and chemical processes. Topics include thermodynamics, kinetics, diffusion, surface reactions, and the behavior of ions in plasma environments. By the end of this course, students will be able to understand and apply these concepts to the study and manipulation of plasma-chemical systems.   |                        |                         |  |                           |  |
| <b>Format of Teaching</b> Lecture, Exercises  |                        |                         |  |                           |  |
| <b>Format of Examination</b> At the beginning of the course, the lecturer determines the form of examination (written exam of 90 min, oral exam of 30 min or in the form of exercises with weekly homework and active participation in the exercises).  |                        |                         |  |                           |  |
| <b>Requirements for the Attribution of Credit Points</b> Depending on the specified form of examination: Passing the written exam, the oral exam or obtaining at least 50% of the possible points in the weekly exercises. In this case, active participation (> 75 %) in the exercises is also mandatory. The form of examination will be determined at the beginning of the course.   |                        |                         |  |                           |  |

| <b>Requirements for Participation</b><br><b>Formal</b> None<br><b>Content</b> Basic knowledge of the concepts and terminology of the Plasma physics are expected, e.g. through participation in the Module „Introduction to Plasma Physics“.<br><b>Preparation</b> Participation in the lecture „Introduction to Plasma Physics II“ is recommended, but is not mandatory.   |                        |                         |                                 |                                       |                                   |
| <b>Learning outcomes</b><br>After successful completion of the module <ul style="list-style-type: none"> <li>• the students have a fundamental understanding of the ion production, their collisional processes and the ion transport in non-magnetized low-temperature plasmas as well as of the influence of these processes on the spatial structure of the discharge.</li> <li>• the students are familiar with the behaviour of plasmas with different levels of collisionality.</li> <li>• the students know the fundamental concepts of sheaths and quasi-neutral plasmas.</li> <li>• the students are familiar with the diagnostic methods for measuring the ion parameters of a plasma.</li> <li>• the students are able to recognize the relations between the discharge conditions (pressure, type of gas, etc.) and plasma parameters (electron temperature and density) and can apply this knowledge for the estimation of the conditions in a laboratory plasma.</li> </ul> |                        |                         |                                 |                                       |                                   |
| <b>Contents</b> <ol style="list-style-type: none"> <li>1. Ion production and loss processes</li> <li>2. Ion collisional processes with charged and neutral particles</li> <li>3. Ion transport in space charge sheaths</li> <li>4. Kinetics of the ion transport</li> <li>5. Ion transport and wave phenomena in plasmas</li> <li>6. Experimental diagnostic methods</li> </ol>   |                        |                         |                                 |                                       |                                   |
| <b>Format of Teaching</b> Lecture   |                        |                         |                                 |                                       |                                   |
| <b>Format of Examination</b> Oral examination within 45 min on given topics with a focus on one or two of these topics.   |                        |                         |                                 |                                       |                                   |
| <b>Requirements for the Attribution of the Credit Points</b> Passing the oral examination   |                        |                         |                                 |                                       |                                   |
| <b>Use of the Module</b> Courses in Physics Major   |                        |                         |                                 |                                       |                                   |
| <b>Importance of the Mark for the Final Grade</b> Graded, but does not contribute to the weighted average final grade   |                        |                         |                                 |                                       |                                   |
| <b>Module supervisor and instructor</b> PD Dr. Tsankov  |                        |                         |                                 |                                       |                                   |
| <b>Further information</b> The lecture will be in English. However, the oral examination may be held on request also in German.   |                        |                         |                                 |                                       |                                   |

## Module 5: Elective Modules from the Catalogue for Minor Subjects

Modules amounting to 5-18 CP can be brought in from the range of other faculties and their subjects. However, should you plan to **write the Master's thesis in the minor subject**, 15 CP must be taken in the minor subject in which the thesis is written.

From the range of courses offered by the Faculty of **Chemistry and Biochemistry (Chemie und Biochemie)**:

| Minor Subject:   | Modules  | Semester  | Language |         |
|--|--|---|----------|---------|
| Inorganic Chemistry<br>(Anorganische Chemie)                       | Methods of Structure Analysis II<br>(Methoden der Strukturanalyse II)  | Summer<br><b>(not in 24)</b>                    | English  |         |
|  | Inorganic Chemistry II (Anorganische Chemie II)  | Summer  | German   |         |
|  | Block Courses Anorganic Chemistry<br>(Anorganisch-Chemisches Grundpraktikum)   | Summer  | German   |         |
| Biochemistry<br>(Biochemie)  | Biochemical Practical Course for Chemists<br>(Biochemisches Praktikum für Chemiker/-innen)   | Winter  | German   |         |
|  | Introduction to Biochemistry<br>(Einführung in die Biochemie)  | Summer  | German   |         |
|  | Biochemistry I (Biochemie I)   | Winter  | German   |         |
| Physical Chemistry<br>(Physikalische Chemie)                       | Compact Course: "Lasers and Optics"<br>(Blockkurs: "Laser und Optik")  | Winter  | English  |         |
|  | Compact Course: "Scanning Probe Microscopy"<br>(Blockkurs: "Rastersondenmikroskopie")  | Winter  | English  |         |
|  | Biophysical Chemistry I<br>(Biophysikalische Chemie I)   | Summer  | English  |         |
|  | Biophysical Chemistry II<br>(Biophysikalische Chemie II)   | Winter  | English  |         |
|  | Physical-Chemical Laboratory<br>(Physikalisch-Chemisches Grundpraktikum)   | Summer  | German   |         |
|  | Physical Chemistry II (Physikalische Chemie II)  | Summer  | German   |         |
|  | Concepts of Spectroscopy and Introduction in Laser Spectroscopy<br>(Konzepte der Spektroskopie und Einführung in die Laserspektroskopie) | Winter  | English  |         |
|  | Concepts of Spectroscopy II<br>(Konzepte der Spektroskopie II)   | Summer  | English  |         |
|  | Industrial Chemistry<br>(Technische Chemie)  | Industrial Chemistry I<br>(Technische Chemie I) | Winter   | German  |
|  |  | Industrial Chemistry II (Technische Chemie II)  | Winter   | English |
| Industrial-Chemical Laboratory<br>(Technisch-Chemisches Praktikum) |  | Summer  | German   |         |
| Theoretical Chemistry<br>(Theoretische Chemie)                     | Theoretical Chemistry I (Theoretische Chemie I)  | Winter  | German   |         |
|  | Theoretical Chemistry II (Theoretische Chemie II)  | Winter  | English  |         |
|  | Electronic and Molecular Structure Theory<br>(Theoretical Chemistry III)   | Summer  | English  |         |
|  | Theoretical-Chemical Laboratory<br>(Theoretisch-Chemisches Praktikum)  | Summer  | German   |         |

From the range of courses from the Faculty of **Geosciences (Geowissenschaften)**:

| <b>Minor Subject:</b>  | <b>Modules</b>  | <b>Semester</b>   | <b>Language</b> |
|------------------------|---|-------------------|-----------------|
| Geophysics*(Geophysik) | Reservoir Geophysics (Reservoirgeophysik)   | Summer            | English         |
|                        | Rock Physics (Gesteinsphysik)   | Summer            | English         |
|                        | Geophysical Practical (Geophysikalisches Praktikum)   | Winter/<br>Summer | English         |
|                        | Seismologic Data Analysis<br>(Seismologische Datenanalyse)  | Summer            | English         |
|                        | Seismic Waves: Theory and Numerical Modelling<br>(Seismische Wellen: Theorie und numerische Modellierung) | Summer            | English         |
|                        | Geophysical Inverse Problems<br>(Geophysikalische inverse Probleme)                                       | Winter            | English         |
|                        | Seismic and Electromagnetic Field Methods<br>(Seismische und elektromagnetische Feldmethoden)             | Winter            | English         |
|                        | Physics of Earth Materials (Physik der Erdmaterialien)  | Winter            | English         |
|                        | Earthquake Seismology and the Seismic Cycle<br>(Erdbebenseismology und der Erdbebenkreislauf)             | Winter            | English         |

\*we recommend an in-person interview with the student counsellor of geophysics (Dr. Maria Kirchenbaur (Studienkoordination-gmg@ruhr-uni-bochum.de), before taking this minor subject!

From the range of courses from the Faculty of **Electrical Engineering and Information Technology (Elektrotechnik und Informationstechnik)**:

| <b>Minor Subject:</b>                                  | <b>Modules</b>   | <b>Semester</b>              | <b>Language</b> |
|--|--|------------------------------|-----------------|
| Plasmatechnology*<br>(Plasmatechnik)                   | Plasmatechnology I (Plasmatechnik I)   | Winter                       | German          |
|  | Fields, Waves and Particles<br>(Felder, Wellen und Partikel)                             | Winter                       | German          |
| Nanoelektronics**<br>(Nanoelektronik)                  | Solid State Electronics (Festkörperelektronik)   | Winter                       | German          |
|  | Nanoelektronics (Nanoelektronik)   | Summer<br><b>(not in 24)</b> | German          |
| Microelektronics<br>(Mikroelektronik)                  | VLSI-Design (VLSI-Entwurf)   | Winter                       | German          |
|  | Integrated Digital Circuits<br>(Integrierte Digitalschaltungen)                          | Winter                       | German          |
| Technology of Energy Systems<br>(Energiesystemtechnik) | Introduction to Technology of Energy Systems<br>(Einführung in die Energiesystemtechnik) | Winter                       | German          |
|  | Technology of Regenerative Electric Energy<br>(Regenerative Elektrische Energietechnik)  | Winter                       | German          |
| Communication Technology<br>(Kommunikationstechnik)    | Systems of High Frequency Technology<br>(Systeme der Hochfrequenztechnik)                | Summer                       | German          |
|  | Digital Processing of Signals<br>(Digitale Signalverarbeitung)                           | Winter                       | German          |
| Medical Technology<br>(Medizintechnik)                 | Ultrasound in Medicine<br>(Ultraschall in der Medizin)                                   | Winter                       | German          |
|  | Tomographical Imaging in Medicine<br>(Tomographische Abbildungsverfahren in der Medizin) | Summer                       | German          |
|  | Image Processing in Medicine<br>(Bildverarbeitung in der Medizin)                        | Summer                       | German          |

\* ONLY if the specialisation in physics is NOT in plasma physics

\*\* ONLY if the specialisation in physics is NOT in solid state physics

From the range of courses from the Faculty of **Mechanical Engineering (Maschinenbau)**:

| <b>Learning Outcomes</b><br>After successfully completing the module, the students <ul style="list-style-type: none"> <li>• can present themselves, their studies and their interests in a concise and comprehensible way</li> <li>• can extract important information from specialised texts by using specific reading techniques. They can use such extracted quotations and evidence to defend their own point of view</li> <li>• Students can work out the function and form of different types of texts and apply this knowledge competently in self-produced texts</li> <li>• can understand both essential and detailed information from listening and reading texts and communicate this clearly, precisely, and concisely to others, both orally and in writing</li> <li>• are able to make a topic of interest accessible to non-experts (laypersons) in a lecture and to answer questions on it</li> <li>• re able to express and ask for personal points of view and opinions, formulate arguments and counter-arguments and point out advantages and disadvantages in a discussion on specialised topics and topics of their own interest</li> </ul> |                        |                          |                                 |                                 |  |
| <b>Contents</b><br>The course is divided into a face-to-face phase (2 hours) and an online phase (freely divisible practice times). The focus of the face-to-face course is on the communicative use of language in reception, production, interaction and mediation, both in written and spoken form. Various reading strategies are taught and applied, and students work with authentic audio and visual texts on Moodle. Furthermore, the specific vocabulary in the field of physics and astronomy is trained. Blended Learning: The course is accompanied by a specific e-learning offer, which is an integral part of the course. It therefore consists of two parts: <ol style="list-style-type: none"> <li>1. face-to-face course.</li> <li>2. moodle course in blended learning format, in which, with the help of the materials provided 4-5 different types of texts are written and revised on the basis of individual feedback</li> </ol>   |                        |                          |                                 |                                 |  |
| <b>Format of Teaching</b> Seminar, practical exercises  |                        |                          |                                 |                                 |  |
| <b>Format of Examination</b> Presentation, written portfolio, Listening-discussion test of c. 30 min  |                        |                          |                                 |                                 |  |
| <b>Requirements for the Attribution of Credit Points</b> Active participation in the seminars (>75%), passing the examination   |                        |                          |                                 |                                 |  |
| <b>Use of the Module</b> Key Competences  |                        |                          |                                 |                                 |  |
| <b>Importance of the Mark for the Final Grade</b> Weighted according to Credit Points   |                        |                          |                                 |                                 |  |
| <b>Module Supervisor and Instructor</b> Mariano   |                        |                          |                                 |                                 |  |
| <b>Further Information</b> This module is offered by the Centre of Education in Foreign Languages ( <a href="http://www.zfa.rub.de">www.zfa.rub.de</a> ).   |                        |                          |                                 |                                 |  |

### List of Additional Key Competences

In justified exceptional cases, modules that are not in this module handbook may also be recognised. For this purpose, a justified request must be submitted to the study advisor (Dr. Ivonne Möller).

### **Note on Programming Languages:**

All modules that deepen a programming language (C, C++, Python, Java, PHP or Modula) can be chosen from the RUB's offer (e.g. the module "Computer Science I (from winter semester 21/22: "Programming for ITS") on the programming language TScript). However, modules that only represent a basic introduction to the understanding of programming techniques cannot be credited in the M.Sc. in Physics.

From the catalogue of the Faculty of **Computer Science (Informatik)**:

| <b>Contents</b><br>a) The seminar dates serve on the one hand to teach the basic methodological skills for project and team management. On the other hand, results from the practical exercises are discussed and problems analysed. The focus is on the exchange of information and feedback from the module supervisor. Leadership protocols and progress reports are prepared.<br>b) In the practical exercises, the participants have the opportunity to apply the acquired knowledge to a group of Bachelor students and to guide them in the implementation of a SOWAS project. From the preparation of the exposés to the final poster presentation, the participants of this module support the SOWAS students both professionally and interdisciplinarily. |                        |                          |  |                           |                                     |

| <p><b>Requirements for Participation</b></p> <p><b>Formal</b> Admission to the Master's thesis has been granted, i.e. academic achievements amounting to at least 50 CP must be proven (including an elective module from experimental physics (9 CP), an in-depth module from theoretical physics (6 CP), the specialisation module (15-25 CP) and the compulsory module "project management" (5 CP)). If the thesis is to be written in the minor subject, at least 15 CP from the minor subject must be proven.</p> <p><b>Content</b> None</p> <p><b>Preparation</b> None</p>  |                         |                          |   |                                 |                                     |
| <p><b>Learning Outcomes</b></p> <p>After successfully completing the module, the students</p> <ul style="list-style-type: none"> <li>• are immediately familiar with the experimental equipment, theoretical models and computer codes from their subject area</li> <li>• have a deeper understanding of the scientific issues in their chosen field of specialisation</li> <li>• are familiar with the most important concepts of time management and project work</li> <li>• can plan the upcoming Master's thesis in terms of time and content</li> </ul>  |                         |                          |   |                                 |                                     |
| <p><b>Contents</b></p> <p>a) In the practical exercises, the required concrete working methods of the group are learned. After an intensive familiarisation phase, the students have the opportunity to participate in the concretisation of their topic for the Master's thesis. In addition, a timetable for the implementation of the Master's thesis is drawn up and its feasibility is checked.</p> <p>b) The seminar serves to develop a concrete topic for the Master's thesis. At the beginning of the seminar, various topics are given out by the supervisors. Individual topics are developed within the seminar series.</p> |                         |                          |   |                                 |                                     |

| <b>Learning Outcomes</b><br>After successfully completing the module, the students <ul style="list-style-type: none"> <li>• can document the current status of their project "Master's thesis" (on a weekly and monthly scale)</li> <li>• can analyse successes, problems and difficulties and work out suggestions for the next project step</li> <li>• have a basic understanding of how to communicate subject content appropriately (orally and in writing)</li> </ul>  |                         |                          |   |                                 |                                     |
| <b>Contents</b><br>a) Seminar A takes place weekly, also during the lecture-free period. Each student first reports on the results of the previous week and analyses the progress and difficulties. The result of this analysis should be the starting point for further planning. The explanations or arguments can be supported by graphs or a presentation. The group discusses the feasibility in terms of time and content with the aim of designing the next work steps as effectively as possible.<br>b) In seminar B, the project "Master's thesis" is presented in the respective working group. The presentation can be given either in the middle of the Master's thesis as an "interim report" or at the end as a "final report". The individual project phases as well as the time planning and implementation are in the foreground in addition to the focal points of the content. |                         |                          |   |                                 |                                     |

| <b>Requirements for Participation</b><br><b>Formal</b> Proof of completion of the module "Knowledge of Methods and Planning a Project"<br><b>Content</b> None<br><b>Preparation</b> None   |                         |                          |                                 |                                 |                               |
| <b>Learning Outcomes</b><br>After successfully completing the module, the students <ul style="list-style-type: none"> <li>• have a deeper understanding of scientific ways of thinking and working</li> <li>• are able to analyse physical questions and solve defined problems using scientific methods within a given period of time</li> <li>• are aware of the requirements of an appropriate, written presentation of demanding and novel scientific results</li> <li>• are familiar with the most important concepts of independent work organisation</li> <li>• are familiar with adequate literature research, citation of sources and the principles of good scientific practice</li> </ul> |                         |                          |                                 |                                 |                               |
| <b>Contents</b><br>Independent construction of an experiment or a theoretical model, independent planning and execution of the experiments or calculations/simulations, analysis of the results, optimisation of the processes, documentation of the process steps.<br>The topic and task must be formulated in such a way that they can be completed within 9 months with a workload of 30 CP.  |                         |                          |                                 |                                 |                               |
| <b>Format of Teaching</b>  |                         |                          |                                 |                                 |                               |
| <b>Format of Examination</b> Writing a scientific paper  |                         |                          |                                 |                                 |                               |
| <b>Requirements for the Attribution of Credit Points</b> Passing the examination   |                         |                          |                                 |                                 |                               |
| <b>Use of the Module</b> Mandatory Module  |                         |                          |                                 |                                 |                               |
| <b>Importance of the Mark for the Final Grade</b> Weighted according to Credit Points  |                         |                          |                                 |                                 |                               |
| <b>Module Supervisor and Instructor</b> Professors and private lecturers of the Faculty of Physics and Astronomy. Upon application, other examiners may be admitted if necessary.  |                         |                          |                                 |                                 |                               |
| <b>Further Information</b> The Master's thesis must be written in the chosen physics specialisation in which the specialisation module was completed. In addition, it is possible to write the thesis in a minor subject upon application.   |                         |                          |                                 |                                 |                               |
